Attachment(s): "Agenda- Security Camera Strategy 09-16-15.docx"

Guys,

Please find attached the Agenda for today's meeting.

We will be going back to the regular time of 9:00Am and meeting weekly.

Thanks
Murray

Hi Eric. Would it be possible for you to split this proposal up into 3 phases? We'll be working with 2 different grant years and likely will have to split the work up between now and Dec 31 then the remainder of the project beginning in 2016. 3 phases would allow us to allocate money to this upgrade without fully expending what we have left to cover maintenance for November and December on the system. It's possible we'd be able to pay for 2 of the 3 phases before the next grant is released but it all depends on how much the invoices come in for monthly maintenance through the end of the year.

I don't know if it makes sense to divide it by 3 and then address the areas that have the most outages/service calls or perhaps you could do it by neighborhood/physical location. That's certainly your call, whatever you think is best. I may have made this more confusing than it needs to be. Sorry about that. I'm headed out of the office over to the EOC but can be reached on my cell (617-686-5208) if you have any questions. Thanks so much Eric and have a great weekend.

Subject: PSnet: Summary of status and activities for June, July, August, 2015

Attachment(s): "smime.p7s"

Andrew, Scott, et al.,

We are summarizing in this memo our PSnet activities and accomplishments over the past three months. The months of June and July were quite busy as we supported the projects that were wrapping up on funding from the prior fiscal year that ended July 31st. August has been a quieter month. This report is broken into three parts: (1) Overview of Status and Areas of Concern, (2) Summary of Activities & Accomplishments, and (3) Plans for Coming Months. We have tried to organize this material so readers can skim to sections of direct interest.

Overview of Status and Areas of Concern

The priorities for PSnet efforts during this period were the same as in our prior report:

1. Fixing operational problems that impact service levels.
2. Monitoring existing and new problems, and determining options for mitigating impact or applying workarounds.
3. Supporting other MBHSR Projects, especially those that needed to meet the July 31st funding cutoff.
4. Deploying and evaluating options for replacing Verizon copper circuits for conventional radio trunking.
5. Support command centers in Boston and Cambridge for the July 4th event.

Overall, PSnet has continued to support all applications with relatively few problems. Problems that have cropped up have been resolved or workarounds were deployed to minimize impact on service. Some of the microwave link problems are being handled by rerouting via alternative paths.

We did experience one significant outage on Saturday, August 15, when the Soldiers' Home site was lost due to a failed UPS, followed later in the same day with a break in Revere's fiber to their Police HQ. Since the alternative path for Revere fiber was via microwave through the Soldiers' Home site, this combined outage disrupted services for Revere and Winthrop, and caused Revere to lose communications to their radios at the Reservoir site. Both problems were repaired, and all services were restored.

One chronic problem area continues to be the behavior of the Motorola MCC7100 Console systems, and their sensitivity to re-routing in the network that causes brief interruptions of communications to the P25 Core lasting more than the couple of seconds, which will then cause alarms to be tripped and fallback to local operations. Some steps have been taken to minimize the occurrence of these routing events, but this problem remains an area of concern. Without changes to the behavior of the Console systems, the best method for resolving this problem involves establishing nailed-up routes to each site via two paths for redundancy. Implementing such static routing will require quite a bit of effort as well as some changes to the communications pathways to Schroeder Plaza where the Core is located. Some dispatch operations have chosen to remain disconnected from the Core due to these problems.

Another area of concern has to do with the health of some microwave links and the poor state of some important backbone sites. The following backbone microwave links are either not working, or performing so poorly as to be only marginally useful.

- JFK <=> Winthrop PD DragonWave Horizon: link is down due to bad power supply, mis-alignment at JFK end, and foliage interference in Winthrop
- JFK <=> Whidden DragonWave AirPair: link is down due to bad power supply and mis-alignment at JFK end
- JFK <=> Somerville PD DragonWave Horizon: link is currently up, but tends to go down every few weeks with intermittent behavior that causes frequent re-routing events
- East Boston HS <=> MITC (EOPSS) DragonWave Horizon: Radio at EBHS has failed for some reason, but a parallel backup pair of Ubiquiti NanoBridges is maintaining connectivity over this path (there are also problems with one-off network switches at both ends)
- Boston PD HQ <=> Northampton Square BridgeWave 80G: link is marginal at best due to very low receive signals; this is backup to the fiber path via BoNet
- Boston PD HQ <=> NE Baptist Hospital BridgeWave 80G: link performs poorly and throws lots of errors; workaround has been to set routing metrics high enough to force traffic to go via longer routes

We also continue to have concerns with the Soldiers' Home and Whidden Hospital sites, both of which need significant work. Some improvements have been made, but structural changes are needed at both sites. The JFK site is a concern simply because it is hard to get access to the radios on the roof, and re-alignment requires a certified tower climber.

One reason for noting the microwave and site issues is that we should deal with some of these problems before we get into the late fall and winter months.

Summary of Activities & Accomplishments

- **Public Safety Voice Radio Systems**
 - Added new VPN connection options for MCC7100 "deployable" consoles to work around some firewall constraints and allow access from more sites. These consoles were used extensively for communications support during the July 4th event without any problems.
 - Developed and tested out an approach for analog radio trunking (i.e., replacement of telco copper circuits) using RAD IPmux-8s to communicate between multiple remote IPmux-1Es and channel banks.
 - Established radio trunking based on the above approach to activate three new radio receiver sites in Cambridge: (1) 50 Churchill, (2) Lesley University at Porter Square, and (3) 675 Mass Ave at Central Square with central distribution at Fire HQ via redundant IPmux-8s and an existing channel bank to connect to comparators. This is intended to be a model for replacing copper circuits throughout the region at modest cost with significant improvements in reliability, manageability, and security. Note that this scheme will also be used to extend communications to new MetroFire radio sites within the Region (i.e., outside of Cambridge).
 - Refined optimization strategies for Ubiquiti 5 GHz microwave radio links to minimize delay, jitter, and packet loss when used to connect to provide packetized voice services to remote radio sites.
 - Discovered additional situations where misconfiguration of Motorola GGM8000s has resulted in duplex mismatch problems. Awaiting input from Skywave and key stakeholders before taking steps to resolve these problems from the PSnet side.
- **CIMS**
 - Provided extensive revisions and updates to deployment guide for 5 GHz microwave radio deployments with detailed instructions for deploying and optimizing Ubiquiti models. While the current focus is on deploying these microwave radios for camera applications, the same approaches have also been used for radio receiver sites in Cambridge and as backup links in other situations. This guide is actively used by the LAN-TEL team.
 - Proposed prioritized list of existing camera backhaul links that should be replaced due to problems. This list has been used to address some of the more urgent problem areas and in planning for additional upgrades.
 - Worked with LAN-TEL to optimize configurations for camera backhaul microwave radios and to resolve interference issues. This work involved tuning and optimizing new clusters of radios (and cameras) in Boston, Brookline, Chelsea, Quincy, Revere, Somerville, and Winthrop.
 - Also dealt with self interference issues between existing 5 GHz microwave radios and newly deployed backhaul radios. In several cases, existing backhaul links have been reconfigured to improve service levels. Also, old equipment is being shut down as new links are introduced to minimize self-interference.
 - Updated firmware on all Ubiquiti radios that have been deployed over the past few months.
 - Continued to audit network for FCC compliance issues, and resolved compliance problems in multiple locations (e.g., Dorchester, Brookline, Everett).
 - Provided a camera backhaul Point-to-MultiPoint design for Chelsea camera upgrades. This design is currently being deployed as a joint exercise with LAN-TEL. Aside, the density of camera deployments within Chelsea requires Point-to-MultiPoint approaches.
 - Revised other deployments in Boston to utilize Point-to-MultiPoint schemes to minimize interference and improve service reliability.
 - Working on resolving network problems caused by use of FluidMesh radios left over from Marathon camera deployments in Boston and Brookline and eliminating these radios entirely from the network. (Aside, FluidMesh radios have not only interfered with other radios and been a source of compliance issues, they have also caused serious problems with backbone operations in PSnet due to nonstandard behavior as they attempt to operate in a self-configured mesh topology. Consequently, these radios will *not* be allowed on PSnet in the future.)
 - Facilitated moves of some existing cameras to take advantage of direct fiber connections or to move new

backhaul links to point at fiber-connected high sites.

- Continued to assist LAN-TEL with server installations at Police HQs.
- Worked with City of Boston to prepare plans for a new network structure to support DVTEL servers at Schroeder Plaza that will allow access via both PSnet and BoNet as well as for internal access from Boston Police.
- Assisted CIMS with improving NTP time synchronization and addressing technical questions arising out of a criminal court case.

- **Support for July 4th Event**

- Lit MIT fiber to the Cambridge Command Center (CCC) in building E51 and installed a temporary switch to support various users working out of this facility during the July 4th event. Also installed a PSnet switch at the Unified Command Center (UCC) at Fisher College in Boston to support various users operating out of this facility, including Cambridge Fire/Police and Boston Fire.
- Interconnected the CCC and UCC via a microwave link using PSnet radios, but with the temporary installation costs borne by MIT (USAi.net handled installation and removal). This was a 750 Mbps AirFiber24 link that worked flawlessly throughout the event. It directly connected the switches at both sites, but was fed from the Cambridge side via MIT fiber.
- Deployed a Juniper SSG5 at each site for secure communications for CJIS applications used by Cambridge Police and dispatchers. These firewalls were configured to provide direct extensions of the Cambridge PD and E911 networks to the CCC and UCC users.
- Supported deployment of multiple MCC7100 deployable console systems at each Command Center and provided secure communications back to the proxy servers at Cambridge and Boston Fire. Aside, we also enabled Boston Fire to test their MCC7100s from the Fenway Fire Alarm site via direct connections to the PSnet switch at Fenway as a way to work around access problems from BoNet.
- Set up network monitoring of all PSnet systems and interfaces at both Command Centers, and monitored status and assisted with technical issues throughout the event. Operational data was captured for future planning purposes.

- **PSnet Extensions**

- Extended PSnet via City of Quincy fiber to four additional sites: (1) Coddington IT network hub, (2) Police Marina, (3) North Quincy High School, (4) Central Middle School; these new sites are in addition to the main High School, Police HQ, Fire Alarm, and EOC that are also reached via City fiber. Each of the four new sites have redundant switches deployed with redundant fiber connections.
- Extended PSnet to radio room on roof of William James Hall (33 Kirkland) on Harvard campus using City of Cambridge and Harvard fiber. The installation is fully redundant with an ATS PDU and redundant fiber links. This is a strategically important new backbone site.
- Brought the 50 Churchill site in Cambridge online as a new radio receiver site for Fire and Police. This site is connected via microwave to the roof of 364 Rindge Avenue (another strategic high site) where City fiber provides connectivity back to Fire HQ.
- Reconnected the Lesley University (former "Sears" tower at Porter Square) and 675 Massachusetts Avenue (Central Square) sites to William James Hall via microwave links and decommissioned the inadequate microwave links that used to go to the Healy Public Safety facility. Both of these sites have been equipped with IPmux-1Es with E&M interfaces to support Police/Fire radio receivers.
- Worked with City of Quincy to move the PSnet equipment at Police HQ into a new rack. This provides additional space for installation of new Quincy switches that will be collocated with the PSnet switches in the same rack. Also installed redundant Tripp Lite UPSs and an ATS PDU to enhance power reliability.
- Performed surveys to confirm feasibility of establishing a new microwave link from William James Hall to the Somerville City Hall and High School complex. Plans have been prepared to implement this as a means of reducing reliance on the existing unreliable microwave links to Somerville PD. From the City Hall complex, we should be able to ride the City's RCN fiber to Somerville PD, as well as to Somerville Fire and other key sites.

- **Hosting Centers**

- Software maintenance is an ongoing, and necessary, activity for supporting the applications environment for services hosted on PSnet. This requires weekly effort, especially dealing with security-related software updates, but also critical bug fixes in the extensive suite of software now supported on PSnet hosting facilities.
- Worked with BRIC on a plan for CrimeView to export data to a repository that will reside at the PSnet hosting centers.

- **FATPOT**

- Established network connectivity to Somerville Fire for FATPOT via City's fiber network, and updated firewall configs to support access to both Police and Fire CAD systems in Somerville.
- Set up FATPOT VM to replace current FATPOT server and we are working with FATPOT team to complete cutover to new VM from old standalone server.
- Continued to support FATPOT developers in deploying next generation, distributed system. This has involved setting up FATPOT CADfusion beta VMs, user accounts, and re-deploying three database servers.
- Updated FATPOT configuration documentation to reflect recent changes and new approaches.
- Configured a Juniper SSG5 for Northeastern University Police to use for FATPOT access. This is awaiting IP assignments from NEU and can be deployed as soon as these are provided. This should serve as a model for similar deployments to other university public safety offices (e.g., Harvard, BU) and even third parties, such as ambulance services.

- **SharePoint**

- Supported Stonewall team on deploying SharePoint 2013 in PSnet data centers on VMs that had been previously deployed.

- Refined configuration of Active Directory services for SharePoint use, and added further accounts for use by developers and for testing.
- **Network Management**
 - Continued updating maps to reflect recent network changes and track changes being introduced as part of CIMS camera upgrades and other network extensions, especially in Quincy and Cambridge.
 - Set up additional notifiers based on new and revised maps. Key users are now receiving these notifications directly.
 - Developed new InterMapper probes for key equipment, and enhanced existing probes to better monitor relevant operational information. Ubiquiti AirMAX models and some older Motorola PTP models now provide considerably more information based on new/enhanced probes. A completely new probe has been developed for the Mimosa B5 radios. Significant enhancements have been made to the RAD IPmux-1E probes, and a new probe has been prepared for the IPmux-8s. Another new probe now provides substantially more diagnostics information from the HP 2510-24 switches widely used in the original CIMS deployments.
 - Deployed a new VM for running various management tools, including the Ubiquiti AirControl application that improves our ability to optimize CIMS camera backhaul links.
 - Improved support for real-time traps, and continued to refine device configurations to generate traps that effectively flag actual problems while minimizing frequency of notifications. Specific efforts have focused on DragonWave microwave links.
 - Provided numerous problem reports and enhancement requests to the InterMapper vendor. Note that we are anticipating a new InterMapper release that we've been told will incorporate several bug fixes and enhancements that we've requested.
- **Network and Site Problems**
 - Replaced ice-damaged power injector for Somerville DragonWave radio that shoots to JFK. Unfortunately, the radio itself at Somerville continues to sporadically exhibit poor performance and operational problems lasting for several days every few weeks, a condition we've observed multiple times over the past year.
 - Restored service on DragonWave AirPair link between Soldiers' Home and Revere Broadway Tower sites.
 - Worked with Sprint to resolve problems with IPsec tunnels to Sprint's data center that were apparently the result of system maintenance. This affected Chelsea mobile communications that utilize Sprint services.
 - Resolved a problem with IPsec tunnel to Chelsea PD used for Sprint mobiles (separate from above problem).
 - Dealt with several operational problems at DCJIS (EOPSS) that affected service to PSnet subscribers.
 - Updated routing metrics to better isolate Brookline and Quincy from microwave-related routing events and to stabilize routing across BoNet. This effort was motivated by the need to reduce occurrences of re-routing events that trigger alarms on the MCC7500 Console systems.
 - Dealt with a serious outage on August 15th that was caused by a City-wide power outage in Chelsea, followed by an unrelated break in the Revere fiber path to their Police HQ. The Chelsea power outage took out the Soldiers' Home UPS (we knew this UPS was in poor health), which in turn caused this vital backbone site to remain off line even when power was restored. Consequently, when the Revere fiber break occurred, Revere lost communications to their primary public safety radio transmitters and receivers at the Reservoir site since the backup path via Soldiers' Home was not available (a third path via Winthrop PD to JFK was also out due to other problems). The Soldiers' Home UPS was replaced by a pair of new Tripp Lite UPSs, which brought this site back on line and restored communications to the Revere Reservoir radios. Later that day, Revere was able to patch around the fiber break. LAN-TEL and D2Five also responded to this critical situation, and the joint effort helped minimize the duration of the outages, as well as with mitigating some of the impact.
 - **Ongoing investigations and known problems** (things we're working on fixing or watching closely):
 - Intermittent problems with DragonWave Horizon microwave link between Somerville PD and JFK. This problem is of immediate concern, as this puts Somerville PD at much greater risk of rain-related outages, since their only other path is via a BridgeWave 80G link that suffers from rain fade. The DragonWave radio at Somerville PD is currently up, but experience indicates that we can't rely on this link.
 - "Foliage fade" issue with DragonWave Horizon link between Winthrop PD and JFK; anticipate that tree trimming would resolve problem. There is also a problem with alignment of the radio at JFK that has further exacerbated problems with weak signal levels on this link. Adding to the problems, the power supply at the JFK end has now failed and needs to be replaced. Note that the lack of this link meant that the double failures in Chelsea and Revere on August 15 resulted in a more serious outage that severely impacted Revere's public safety radio systems.
 - Power supply failure for DragonWave AirPair at Whidden Hospital that shoots to JFK. Companion radio at JFK is seriously out of alignment, but power supply needs to be replaced before re-alignment can be performed.
 - Loss of DragonWave Horizon microwave link between East Boston High School and EOPSS/MITC in Chelsea; currently operating on backup Ubiquiti NB5G22 link. There are also problems with equipment on the MITC roof that need to be addressed and we need to terminate BoNet at the EBHS end, which will require upgrading the switch.
 - Cisco switch at Whidden is reporting internal interface memory errors, perhaps due to increased temperature in this radio room. So far, this has not impacted service, but we intend to replace this switch in the near future.
 - Whidden Hospital outdoor rack lacks any form of active cooling (not even fans), and temperature-related failures are expected. Somehow, this equipment has continued to work during the summer, but we're really operating on borrowed time.
 - Winthrop Water Tower site has no UPS installed.

- Ethernet cabling problems to DragonWave Horizon radios at Burton Faulkner site need to be addressed; we will probably need to run new cable.
 - BridgeWave link between Schroeder Plaza and 35 Northampton has also been performing poorly, primarily because of weak receive levels. Re-alignment might resolve the problem. Although this has historically been one of the most heavily used links in the PSnet backbone, we have changed routing metrics so that this link only operates as backup to the BoNet connections.
 - BridgeWave link between Schroeder Plaza and NE Baptist Hospital continues to be intermittent. We suspect that a primary cause is that this link was not properly engineered initially. It is also likely that one of the radios is out of spec. The urgency for dealing with this has been mitigated by the introduction of the Mimosa microwave link between Brookline Town Hall and MIT Tang Hall.
 - DragonWave power injector and lightening arrestor (single unit) needs to be replaced at Cambridge "Courthouse" due to cracked enclosure (currently being held in place with zip ties). New shielded cable also needs to be run to the DragonWave radio. Note that this microwave link between Courthouse and Schroeder Plaza is one of the most important within PSnet, and is of particular importance to Cambridge for radio applications.
- **Miscellaneous**
 - Continued audit of all access to the public Internet from PSnet. This is another weekly activity that is a necessary security practice. We continue to identify misconfigured systems that inappropriately attempt to direct traffic to the public Internet, but such access is generally blocked by the PSnet firewall. We also correct such misconfigurations where we have control of the offending systems, or work with other players to resolve such misconfigurations.
 - UPS batteries are also being replaced or we have swapped out UPSs to prevent problems or restore services. When UPSs are replaced with the newer Tripp Lite equipment purchased last year, we are reconditioning the older UPSs so they can be used at smaller sites.
 - Worked with City of Chelsea, D2Five, and Motorola in reviewing conditions and issues at the Soldier's Home site and contributed to plans for upgrading this site.

Plans for Coming Months

Listed below in approximate priority order are things we *should* be doing over the coming months to maintain PSnet operations and provide support to key initiatives. Since the current budget will not support all of these activities, some hard decisions will need to be made as to how to set priorities.

1. **Maintenance and repair of radios at JFK site**

There are multiple issues that need to be dealt with at the major JFK backbone site, but the highest priority is maintenance and repair of the backbone radios before the winter weather sets in. There are two radio links that are currently down (Winthrop PD and Whidden) and all five radios need to have alignment checked, and any maintenance to deal with frayed cables and lightning arrestors performed. We will need to engage microwave experts who in turn will need to be supported by a certified tower climber. There is at least one full day of work required for just the maintenance of the radios on the roof. None of these radios are easy to get to. If we encounter cable issues, additional time may be required to replace these cables--this is a suspected problem. We also need to install a PDU with ATS so that power to individual radios can be remotely controlled (the existing PDU has failed despite having been previously replaced). This work needs to be completed by November 1st, but should be done as soon as we can make arrangements with the various players.

2. **Upgrade Whidden Hospital site**

To be blunt, this site is a disaster waiting to cause a calamity. The immediate priority is to establish a new cable path to the roof from the radio room just below the roof. PSnet equipment (including UPSs) is installed in the radio room, but all the microwave radio power supplies are located in an outdoor rack with no ventilation (the built-in A/C unit failed several years ago). With a new cable path, we can then move the microwave radio power supplies into the radio room, so they will be on UPS power. Currently, any power outage at Whidden takes out the entire site, since all microwave radios are powered from the outdoor rack and are not on UPS. This is the only site serving Everett. We also remain concerned about the lack of A/C for the radio room, which gets quite hot.

3. **Repair EBHS to MITC link and upgrade EBHS site**

The DragonWave radio link between EBHS and the Commonwealth's data center at 200 Arlington in Chelsea (Mass IT Center, or MITC) has been down for several months. It is backed up by an Ubiquiti radio link, so service has not been lost. However, last year's snow took out the Ubiquiti radio due to the way it is placed on the roof, and this could happen again this coming winter. We also need to install UPSs and a PDU at this site, since there is no power protection available. The currently deployed network switch connects to BoNet, but is unable to terminate the BoNet connection, which presents operational problems (the BoNet connection is actually terminated on a PSnet switch in the DCJIS data center at MITC). Consequently, we also need to replace this switch with a true Layer 2/3 switch. There are also some issues that need to be addressed on the MITC end of this link.

4. **Upgrade Winthrop Water Tower site**

This is the last backbone site within PSnet that has not been upgraded with redundant Layer 2/3 switches. This site also lacks any UPS protection, although there is a generator. Without a UPS, the equipment still goes down every time the power goes out since it loses power until the generator kicks in. This is a strategically important site to the overall integrity of the backbone, and it provides one of the two links into Quincy. Most Winthrop cameras are also backhauled via this site.

5. **Support CIMS backhaul upgrades and extensions**
New camera backhaul links are being added in Boston, and existing links are being replaced with new radios. Since these systems are integrated into PSnet backbone nodes, it is essential that the PSnet team work with the CIMS team to facilitate integration of these microwave backhaul links. PSnet is also in a position to provide new fiber-connected high sites that can be used to resolve problems with line-of-sight to camera locations. There is also on-going work to refine recent camera backhaul deployments and improve reliability and capacity for some of the links. An essential aspect of this work is managing spectrum assignments to minimize interference problems, including interference from new backhaul links that can affect existing PSnet/CIMS microwave links. There is a lot that needs to be juggled here to achieve the desired results in a compliant manner.
6. **Support overhaul of network connections to CIMS servers at Schroeder Plaza**
The CIMS (DVTEL) servers at Schroeder Plaza are going to be moved to a new subnet based on a Cisco 3850 switch that has just been ordered. This will rationalize connections between the servers and PSnet, BoNet, and Boston Police networks. PSnet will need to support integration with the 3850 switch and delivery of camera traffic to these servers, as well as regional access to central video services, such as the HarborView system.
7. **Resolve rain fade issues with BridgeWave radios from Schroeder Plaza and NE Baptist Hospital**
The two BridgeWave 80 GHz radios that connect Schroeder Plaza to NE Baptist Hospital and 35 Northampton have been performing poorly for quite some time. Both of these links are extremely susceptible to rain fade, and even light showers have degraded performance to unacceptable levels. Routing metrics for these links have been increased to deflect traffic toward other paths. One reason for the poor performance is that these models do not include the Adaptive Rate option that helps overcome rain fade problems. Past efforts to resolve these problems have not been effective, and so new options need to be considered. Probably the least expensive option would be to deploy parallel radio links using 5 GHz or 3.65 GHz radios to provide rain fade immunity, albeit at lower data rates. Another possibility would be to use new technology such as the Mimosa B5 radios that have been deployed for the Brookline to MIT link. In addition, we also need to provide a similar backup capability for the BridgeWave 60 GHz radio link from NE Baptist to Brookline Town Hall. These changes are precursors to a separate initiative to try out alternative routing approaches to resolve the MCC7500 console issues for Brookline (see below).
8. **Support RECC implementation in Revere/Winthrop**
As the new RECC is being built out at Revere Police HQ, structural changes are being made that require moving PSnet and CIMS equipment, which will also require changes to network connectivity within this building. Furthermore, we need to rework some of the fiber connections to other sites to implement path redundancy to the Reservoir and Fire HQ sites utilizing City fiber. We have already freed up fiber pairs, so this mostly involves re-patching fiber connections. These changes cannot be avoided, and are also essential to successful activation of the new RECC.
9. **Continue to deploy and evaluate radio trunking solutions**
In addition to the deployment of radio trunking solutions in Revere and Cambridge that are now in production use, effort has already been expended to also deploy radio trunking solutions in Everett and Chelsea. All that is really needed is coordination with public safety radio users and radio technology experts to turn on these trials and begin gathering operational experience. This should be a modest background effort, but one that will equip the region with worked examples and live operational experience. Note that tools have been developed that will allow rapid fallback to legacy copper circuits should problems be encountered so that risks can be managed. We will also continue to work the City of Cambridge as they add other radio sites to the system already deployed. In addition, we plan to support a new MetroFire radio deployment to Soldiers' Home leveraging the same Cambridge system running over PSnet.
10. **Develop workarounds to Motorola MCC7500 Console connectivity issues**
Resolving the MCC7500 connectivity problems for all console sites requires a substantial effort. However, we first need to try out at least one alternative approach for nailing up paths to avoid the impact of rerouting events. We recommend trying this out for one Console site, and Brookline is probably the easiest to work with, especially since we've already implemented an alternative path from Cambridge via the Mimosa link. A complicating factor is that we have been unsuccessful in arranging for the type of service we need from BoNet to implement this sort of solution. Consequently, we need to establish reliable microwave connections out of Schroeder Plaza (see related effort described above). Assuming this approach achieves the desired improvement in stability of the Console systems when connected to the Core, then we can prepare plans to extend this approach to the other Console sites.
11. **Support FATPOT initiatives**
Modest efforts will be required to provide support to the FATPOT developers and support staff as they move the existing FATPOT server to a new VM and introduce the next generation system for trial use. We will also have a role in extending FATPOT services to Northeastern University Police. Given our excellent working relationship with FATPOT technical staff, this should be a background activity over the next few months, and is not expected to consume lots of PSnet effort. However, it is likely that more PSnet effort will be necessary to work with the various municipalities as we transition them to the next generation CADfusion system.
12. **InterMapper support**
Working to keep InterMapper maps up to date as changes are introduced in the network is a constant, on-going activity. In addition, we anticipate receiving a new InterMapper release that will have to be staged, tested, and then put into production. This new release should address several problems we have documented and worked with the vendor to characterize and resolve.
13. **Establish new connection into Everett from Revere Reservoir site**
PSnet services into Everett are inadequate due to the many problems/issues associated with the Whidden site, since that this is the only site serving all of Everett. Consequently, another path into Everett is a high priority to resolving their connectivity problems, in addition to upgrading the Whidden site (see above). We have done the survey work to establish a new microwave link from another Everett high site to the Reservoir site in Revere. Since the Reservoir site is well-connected via redundant fiber paths, and it is a high-quality new site, this should result in substantial

improvements to service reliability for Everett.

14. **Establish new connection into North Quincy High School**

Quincy is also served by a single PSnet backbone site at Quincy High School on Coddington Street. Any problems at this site will take all of Quincy off PSnet. We have now leveraged City fiber to extend PSnet to North Quincy High School on Hancock Street. This site is much closer to Boston, which makes it feasible to use shorter microwave links to a fiber connected site in Boston. Note that the two microwave links to Quincy High School are also the two longest microwave links in the PSnet backbone. One concern is that if we shoot from NQHS to a BoNet site in Boston, we will need to make arrangements for a more robust BoNet service than we have been constrained to using so far, especially if we are going to resolve the MCC7500 connectivity issues.

15. **Establish new connection into Somerville City Hall from William James Hall site**

Although Somerville has two PSnet backbone sites at the Police HQ and the Burton Faulkner apartment tower, the microwave links into the Police site have operational problems. Furthermore, nearly all of Somerville's CIMS cameras are backhauled through the Burton Faulkner site. Since Somerville does have RCN fiber to most of their municipal sites, we need to interconnect PSnet with Somerville's fiber, which is hubbed out of City Hall. By leveraging the excellent line of sight we have from the City Hall complex to the William James Hall site in Cambridge, we can directly interconnect Somerville fiber with PSnet/Cambridge fiber. We could also implement a very short microwave link from the City Hall complex to the adjacent Burton Faulkner site. This would greatly reduce reliance on the microwave connections into the Police HQ, and will set the stage for eventually getting off the private Burton Faulkner apartment building.

16. **Support BRIC deployment of CrimeView database on PSnet servers**

The BRIC has indicated a desire to move the database collected from FATPOT CAD feeds out of their isolated environment onto PSnet servers at Schroeder Plaza. This would entail standing up a new VM and working with BRIC staff and FATPOT to redirect feeds to the new PSnet VM. The existing database would also need to be exported to the new VM. This should not be a large effort based on our current understanding of what needs to be done.

17. **HP 3PAR training**

When the Region acquired the HP 3PAR storage systems as part of the server platforms deployed last year, we were given training course credits. We are coming up on the point where if we don't use these credits, we will lose them. It is not clear who within the Region should take these courses. The Interisle consultants provide the operational support for the server platforms, so it perhaps makes sense for one of us to take advantage of these courses before the opportunity is lost. Other suggestions would be welcome. We can also inquire into the feasibility of delaying use of these credits until the start of the next fiscal year funding.

If you have any questions, or would like for us to expand on any of the topics listed above, please let us know. We welcome any feedback.

...Chuck

Andrew,

As per our conversation today, all camera upgrades for BPD should be directed to me.

I have not see the proposals or the timeframes for the implementation.

I have heard third hand that this will be in three parts but again please include any documentation directly to me. I will also schedule a meeting so I can get up to speed.

Regards
Shawn

Subject: JFK radio alignment

Hi Eric. I know this is more of an Interisle job but because of budget constraints and their lack of a certified tower climber I'm coming to you for advice. I believe you know a bit about the issues associated with the microwave radios at the JFK site (some may have fraying cables, others are simply mis-aligned). I'm wondering if Lan-Tel has a tower climber on staff? If so, do you think you may be able to assist Chuck with these fixes? Hope you're inside and staying cool today. Thanks.

Andrew

Not being "that guy" and I have been looking at this from the sidelines . I have also been servicing these antennas since 2007 . We never had a tower climber perform any work up there on these antennas . It was easier to turn this work over to Interisle then recieve the constant emails. would think that the vendor that Chuck uses USAII ? Would have some one schooled on this work .

I can certainly take care of and make this go all go away.

Ha, I promise you're never seen as that guy and I completely understand what you're saying. I think Chuck's hesitation to take the lead is because he has a strict monthly budget and this one project likely would eat it all up in a couple days. I will wait a few days and see if Chuck can get his act together and make something work. I will keep you posted. Thanks Eric.

Subject: Update Work stations

Andrew :
Work stations have been installed at :
Quincy
Winthrop
Revere
Chelsea

We are working at Everett this coming Thursday.

Brookline
Somerville
Boston
Will be scheduled within the next two weeks .

We have also been upgrading to software 6.4 while we perform this .

I will send you an update when we complete.

Andrew,

Based upon our review of the Camera upgrade, we approve of the three phases and request that Lan-Tel proceed with implementation as per the Lantel Proposal.

I will like to take this opportunity to thank OEM, LANTEL and Vin Stancato for your efforts in upgrading the BPD camera system.

Thank you

Hi Eric. We may have some updates on this. Continue with ordering hardware but hold off on installation if you can. We just want to make sure we're not double covering an area that already has BTD cameras for example. If that's the case we'll find a location for those cameras. I will keep you posted. Thanks.

Subject: RE: ShotSpotter (Chelsea, MA) - Camera integration

Our camera system was NEVER integrated with ShotSpotter.

The chief is upset because cities that had theirs installed after us have had them working for a while. According to the Chief, we supposedly have more gunshots going off in our city than any of the other UASO city and more than most other Shot Spotted customers. We also want to get the alert to pop-up in our cruisers.

I am going to be the PIC for getting this project completed.

On Sep 30, 2015, at 3:09 PM, "Ronald Cayabyab" <RCayabyab@shotspotter.com> wrote:

Hello Cpt. Batchelor,

I was informed that you will be pursuing camera integration soon and wanted to give you information regarding that. We have an API called Notification Engine (NE). The document attached will help explain in detail, how to successfully integrate with ShotSpotter.

Additionally, the public IP for our NE is 107.0.144.107. When we have decided to move forward, you can provision this src IP on your firewall leading to your vms endpoint. Also, ICMP is disabled on our end so ping won't work. Also, once we have decided connection type (*Socket*, *HTTP GET*, *HTTP POST(XML)*) and packet type, I will be able to set up your instance of NE on our api server. I will also need the IP and port or url of your vms endpoint.

Below is an xml payload sample of our recommended packet type (ialrt04). You can decide how much information you receive based on different packet formats shown in the document attached.

[<image001.png>](#)

<!-- NOTE: the Checksum Indicator, Checksum, and Message Ending fields are not included in the XML form, because we are relying on TCP/IP to do that level of error correction. -->

Please let me know when you would like to discuss how we move forward.

Best regards,

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration

No Andrew it has been . I spoke with Pam on this Friday afternoon . My understanding is that a new LT. Is taking over on Monday . He was inquiring about "signals" received from Shotspotter to Dvtel software . I will say we did have to re enter some data and presets into cameras since this project coincided with the overall upgrade .

Since myself or Pam couldn't definitely understand what criteria or information that the Lt was looking for during our phone conversation, I told Pam and the LT that we will do a full test with Shotspotter , and the Lt on Wed and go over the whole system as needed and answer any questions that he might have . It will be beneficial to us as well since I do not know how they display at Chelsea for SS .

Hello Cpt. Batchelor,

I was informed that you will be pursuing camera integration soon and wanted to give you information regarding that. We have an API called Notification Engine (NE). The document attached will help explain in detail, how to successfully integrate with ShotSpotter.

Additionally, the public IP for our NE is 107.0.144.107. When we have decided to move forward, you can provision this src IP on your firewall leading to your vms endpoint. Also, ICMP is disabled on our end so ping won't work. Also, once we have decided connection type (*Socket, HTTP GET, HTTP POST(XML)*) and packet type, I will be able to set up your instance of NE on our api server. I will also need the IP and port or url of your vms endpoint.

Below is an xml payload sample of our recommended packet type (ialrt04). You can decide how much information you receive based on different packet formats shown in the document attached.

<image001.png>

<!-- NOTE: the Checksum Indicator, Checksum, and Message Ending fields are not included in the XML form, because we are relying on TCP/IP to do that level of error correction. -->

Please let me know when you would like to discuss how we move forward.

Best regards,

No Andrew it has been . I spoke with Pam on this Friday afternoon . My understanding is that a new LT. Is taking over on Monday . He was inquiring about "signals" received from Shotspotter to Dvtel software . I will say we did have to re enter some data and presets into cameras since this project coincided with the overall upgrade .

Since myself or Pam couldn't definitely understand what criteria or information that the Lt was looking for during our phone conversation, I told Pam and the LT that we will do a full test with Shotspotter , and the Lt on Wed and go over the whole system as needed and answer any questions that he might have . It will be beneficial to us as well since I do not know how they display at Chelsea for SS .

Subject: RE: ShotSpotter (Chelsea, MA) - Camera integration

Our camera system was NEVER integrated with ShotSpotter.

The chief is upset because cities that had theirs installed after us have had them working for a while. According to the Chief, we supposedly have more gunshots going off in our city than any of the other UASO city and more than most other Shot Spotted customers. We also want to get the alert to pop-up in our cruisers.

I am going to be the PIC for getting this project completed.

Thanks Mike. AIC recommends a very simple test (no logs, etc.):

We act as a TCP server in ShotSpotter.

Please close the App Server and instead, run the attached **on the App Server** machine and ensure that we get notifications from the configured shot spotter Notification Engine. Other helpful troubleshooting steps are noted in the manual's Troubleshooting section.

I have been monitoring the Chelsea server and even did a reboot to make sure that I don't have any events reaching the DVTEL software. I am going to engage DVTEL support at this time to see if they can see anything in the logs and find out if I am getting any signals. In Boston, I just log into Control Center and the messages flood onto my screen. In Chelsea I am not getting anything.

I will update as this progresses.

Subject: Re: Shotspotter

Eric, Nikhil,

For what it's worth, I am seeing traffic from <10.112.0.250> to <10.20.61.77> with dest. port of 1111. This traffic is now being delivered to <10.0.77.200>.

I assume the source address is the ShotSpotter notification server. If not, we should investigate. It would help to have a list of IP addresses on the ShotSpotter side that we expect traffic from, with some indication as to what the roles are of the associated hosts.

Eric, et al.,

I'm glad we checked. I just now updated the NAT rule on the firewall, so the traffic should now get to the correct server. Nothing needs to be done on the ShotSpotter end.

Here is the table of server addresses I previously sent out. Could you please review this, and let me know if there are any other corrections required?

DVTEL Server Location	Actual DVTEL IP	NAT'ed DVTEL IP
Everett PD	10.0.73.205	10.20.61.73
Revere PD	10.0.76.200	10.20.61.76
Chelsea PD	10.0.77.200	10.20.61.77
Somerville PD	10.0.84.201	10.20.61.84

Note, I've changed the Chelsea address above to reflect the updated info.

Subject: Re: Shotspotter

Eric, Nikhil,

I have checked the IPsec tunnel status, and everything continues to look good. I am seeing packets incrementing the packet counters associated with the NAT rule for Chelsea, so it appears that traffic is being sent.

Let me confirm that the Chelsea DVTEL server is at <10.0.77.202>. It would also help to confirm that a ping from the ShotSpotter notification server to the NAT address <10.20.61.77> gets a response from the Chelsea DVTEL server.

I have started a packet capture that will hopefully pick up the next notification event. I will see if that tells us anything useful.

Subject: Deleting Shot Spotter Cameras

We are currently involved in an upgrade of many of the older cameras in the entire CIMS area in the Boston area. Many of the old cameras that are being replaced by the new DVTEL cameras are included in the Shot Spotter system. I have attempted to delete the old camera so I can add the new one but I have been stopped by Admin Center because it says that Shot Spotter has that camera:

The Broadway (Upper) cannot be removed because:
ShotSpotter system: Broadway (Upper) AlarmType using it in the Alarm scenes field

If I log into Control Center and attempt to clear the alarms, I can only clear 150 at a time and then I have to close and reopen Control Center to get the next 150. During testing, Shot Spotter sent alarms almost constantly for months. There are far too many alarms to clear. Is there a way to clear out the backlogged alarms all at once? We have cameras down until I can resolve this.

Thanks,

Eric

I didn't scroll down . This LT in particular has been very critical of during our upgrade of Chelsea . Even though he worked from 11 pm to 7 AM I offered to come in and sit down and go over the whole system , hear any concerns and listen to input . This did not happen . His only conduit to us so far has been mass emails to Chief Kyes. . I believe a side bar with Pam would give you more insight into what we have been dealing with .

Hello Andrew,

I have checked our API logs and see that the last gunshot incident (Flex ID# 8038) was published on October 4th by our Incident Review Center. A Notification Engine alert was sent to DVTel's VMS endpoint at 10.20.61.77 on port 1111. According to our logs, we are getting "connection refused." Is the VMS server endpoint still up? I tried to telnet into this IP and port and cannot connect.

Please let us know what you find or if you require our assistance.

Thanks and regards,

Andrew,

Thanks for letting us know. This is the first we are hearing of an issue with the integration. It was installed and tested successfully during the initial integration.

I will look at the server this evening and respond as soon as I have some information.

Eric

Andrew

Eric is still looking into this. Overall Looking at this it seems there is not an indicator or trigger to notify if this has failed. Myself and Eric discussed that we will perform a Shotspotter test on the 15th or middle of the month across all towns who have Shotspotter.

Thanks for the heads up Eric. We're getting pressure from Chief Kyes in Chelsea to get this back up and running (several instances of reported gunfire over the last couple days) so if there's anything that can be done prior to the 15th that would be extremely appreciated. Have a great day.

I have been looking into the Shot Spotter integration for the Chelsea PD and it is online according to the Admin Center application. This is the only indication that I would have of it not working and it is telling me that everything is fine. Even the cloud notification would not have alerted us because according to the DVTEL system, everything is fine.

We are going to have to work in some kind of a monthly test with Shot Spotter to confirm operation if this can be the case.

Eric

Thanks for the heads up Eric. We're getting pressure from Chief Kyes in Chelsea to get this back up and running (several instances of reported gunfire over the last couple days) so if there's anything that can be done prior to the 15th that would be extremely appreciated. Have a great day.

Eric is still looking into this. Overall Looking at this it seems there is not an indicator or trigger to notify if this has failed. Myself and Eric discussed that we will perform a Shotspotter test on the 15th or middle of the month across all towns who have Shotspotter .

Andrew,

Thanks for letting us know. This is the first we are hearing of an issue with the integration. It was installed and tested successfully during the initial integration.

I will look at the server this evening and respond as soon as I have some information.

Eric

Subject: ShotSpotter (Chelsea, MA) - Camera
integration inquiry

Hello Andrew,

I have checked our API logs and see that the last gunshot incident (Flex ID# 8038) was published on October 1st by our Incident Review Center. A Notification Engine alert was sent to DVTel's VMS endpoint at 10.20.61.77 on port 1111. According to our logs, we are getting "connection refused."
Is the VMS server endpoint still up? I tried to telnet into this IP and port and cannot connect.

Please let us know what you find or if you require our assistance.

Thanks and regards,

Ron Cayabyab

Eric,

Currently, I am unable to reach the vms endpoint at [REDACTED] port 1111 with a src ip of [REDACTED]. Can you check your logs to see why we are getting refused and provision this ip in your firewall if you haven't already done so? Also, I haven't received an invite for our meeting tomorrow. Will you be sending that today?

Thanks,

Ron Cayabyab

Attachment(s): "smime.p7s"

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <10.112.0.0/16> on the ShotSpotter end and <10.20.61.0/24> on the PSnet end. Only addresses from the <10.112.0.0/16> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Attachment(s): "smime.p7s"

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against [REDACTED] and its ilk? As a reminder, we run a ping watchdog against your test host, [REDACTED]. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against [REDACTED] and its ilk? As a reminder, we run a ping watchdog against your test host, [REDACTED]. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of [REDACTED], you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your [REDACTED] address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <[REDACTED]> on the ShotSpotter end, and <[REDACTED]> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <10.112.0.0/16> on the ShotSpotter end and <[REDACTED]> on the PSnet end. Only addresses from the <10.112.0.0/16> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Subject: PSnet: Update on outage of Microwave link from Revere Broadway Tower to Boston JFK

Attachment(s): "smime.p7s"

Folks,

As I reported back on October 2nd, we lost the DragonWave AirPair microwave radio at the Revere Broadway Tower site that shoots to the JFK Building in Boston. At the time, we had assumed this was a power supply failure, which has been a frequent problem with the DragonWave radios. However, Mark Savage went on site this morning, and found the power supply was not the problem. I worked with Mark remotely, and after several reconfigurations and tests, we concluded that the radio itself has failed. Consequently, we don't have a quick fix, and this is going to be a lot more expensive to repair. More on our options below, but first the consequences.

While the network has re-routed around this failed link, the primary concern is that Revere and Winthrop are only connected to the PSnet backbone via Soldier's Home. Should we lose the Soldiers' Home site, then Revere and Winthrop would become disconnected from the backbone. Another concern is that, with two other radio links into JFK down, we only have two active links (out of 5) that reach JFK, which is an important site in its own right.

The best near-term option for improving the situation is to restore the links from Winthrop PD and Whidden into JFK. This requires site work at JFK on both of the radios, plus we need to resolve the problem with foliage interference at Winthrop PD. If we can get these two links back on line, then the situation will be substantially improved, even without the link between JFK and Broadway Tower. We have been working toward making these repairs already, and we'll aim to accelerate this work.

Another option would be to go forward with putting in place a new link between Everett and the Revere Reservoir site. This has been planned as a way to provide a second path into Everett, where currently everything relies on the Whidden Hospital. Note, installing this link may be comparable in cost to repairing the failed DragonWave AirPair.

I will continue to provide updates on this situation as we work toward mitigating the problems.

Hi Vickie or Eric. Can you confirm what exactly this equipment is for? If it's part of the standard monthly maintenance then is there a reason it's not just added to the monthly invoice? Perhaps it's part of Boston's larger upgrade, although I can't imagine we would be billed piecemeal like this. Any clarification you can provide would be appreciated. Thanks so much.

Hi Vickie or Eric. Can you confirm what exactly this equipment is for? If it's part of the standard monthly maintenance then is there a reason it's not just added to the monthly invoice? Perhaps it's part of Boston's larger upgrade, although I can't imagine we would be billed piecemeal like this. Any clarification you can provide would be appreciated. Thanks so much.

Subject: PSnet: Update on outage of Microwave link from Whidden Hospital to Boston JFK

Attachment(s): "smime.p7s"

Folks,

Unfortunately, we have another DragonWave AirPair 200 that has failed. In this case, the radio is the one that was at Whidden Hospital shooting to JFK. Yesterday, Dave Menzies and I were on site at Whidden working on connections to Everett's public safety radios, and we had planned to also replace what we suspected was a bad power supply on this AirPair (power supplies have been a chronic problem with all DragonWave models). However, we found the power supply was fine, and the proper voltage was being delivered to the radio itself. Despite good voltage readings, the radio itself was dead, with no indication of being powered on.

Dave and I took this radio down, and I will explore the potential for having it repaired. However, since we recently had a nearly identical failure of the same model radio at the Broadway Tower site (also shooting to JFK), I want to retrieve the Broadway unit as well so we can look into getting both units repaired.

For the record, the Whidden AirPair 200 failed back in April. However, this link was barely functional due to what we've assumed was a misaligned radio on JFK. Of course, we can't realign the JFK radio until we get the Whidden end repaired.

The JFK site has historically been one of the most important backbone sites in PSnet (and CIMS), with five backbone links to Somerville PD, Everett Whidden, Revere Broadway Tower, Winthrop PD, and 35 Northampton. However, of these five backbone links, only two (Somerville PD and 35 Northampton) are currently working. We believe that the link to Winthrop PD can be repaired by replacing what we're hoping is just a bad power supply. However, this link needs to be re-aligned. Fortunately, the trees that were blocking the Winthrop end have now been trimmed back, so we can proceed with this alignment. With the links to Whidden and Broadway Tower out, we really do need the link to Winthrop restored ASAP.

I should also point out that we've been working with LAN-TEL to be able to decommission the three camera backhaul links that are currently on JFK. This should be accomplished in the near future.

Since we've anticipated that we may want to move off of the JFK site at some point, perhaps these backbone microwave failures and elimination of the camera backhaul links presents an opportunity to advance this objective.

I should also note that the FCC licenses for these two failed AirPair links are due to expire next August, and will have to be renewed if we want to continue using these links.

Strategically, we may want to consider investing in fiber links to the Northeast quadrant of MBHSR instead of repairing these failed links. If we can leverage fiber to the Commonwealth's data center at 200 Arlington in Chelsea, and MBTA fiber on the Blue Line to Beachmont station, then we would not need all of these long backbone microwave links, and we could better improve network resilience and survivability with shorter links between key facilities.

Subject: Re: PSnet: Update on outage of Microwave link from Whidden Hospital to Boston JFK

Attachment(s): "smime.p7s"

Eric,

You asked: Can we use Ubiquiti dish antennas as a temporary means until these links are repaired or placed somewhere else? Is the data traffic that substantial?

The data rates are not the issue. Instead, the distances involved are a bit much for unlicensed radios. If we were in a more rural area, then we could go these distances with 5 GHz radios, but I think we should be concerned about the amount of interference we're going to see trying to go so far, especially when one end is aimed at downtown Boston. After all, when we put in the 5GHz link between Soldiers' Home and Chelsea PD, the Soldiers' Home radio was seeing office WiFi in many of the downtown Boston buildings, including the State Office building at 1 Ashburton. When you look toward JFK from any of these other sites, you see a mountain range of tall buildings, all housing multiple sources of interference on the unlicensed bands.

Another option that we might consider would be to deploy a licensed microwave link from 1 Ashburton to Soldiers' Home. That would actually do a lot to improve regional resilience, especially given the importance of the Soldiers' Home site, which is not on fiber. The 1 Ashburton site is almost identical to JFK in terms of location and height, but it is on Loop A fiber, and so it would be much better for resilience and would improve weather immunity. Unfortunately, we do not have fiber into JFK, and heavy rain has at times taken out all five microwave links, which then greatly diminishes overall regional network capacity and resilience.

What we can also consider is putting in more unlicensed microwave links within the communities of Somerville, Everett, Chelsea, Revere, and Winthrop. This could also help with network resilience, including weather immunity, since the 5 GHz band is for all practical purposes immune to rain fade. For example, we've been planning to install a new link from the Revere Reservoir site into Everett, probably to the Housing Authority high rise. However, this does not address the regional connectivity into the PSnet backbone, though it would provide more ways to get to backbone links. We just need those backbone links somewhere.

Can we use Ubuquity dish antennas as a temporary means until these links are repaired or placed somewhere else ? Is the data traffic that substantial ?

Folks,

Unfortunately, we have another DragonWave AirPair 200 that has failed. In this case, the radio is the one that was at Whidden Hospital shooting to JFK. Yesterday, Dave Menzies and I were on site at Whidden working on connections to Everett's public safety radios, and we had planned to also replace what we suspected was a bad power supply on this AirPair (power supplies have been a chronic problem with all DragonWave models). However, we found the power supply was fine, and the proper voltage was being delivered to the radio itself. Despite good voltage readings, the radio itself was dead, with no indication of being powered on.

Dave and I took this radio down, and I will explore the potential for having it repaired. However, since we recently had a nearly identical failure of the same model radio at the Broadway Tower site (also shooting to JFK), I want to retrieve the Broadway unit as well so we can look into getting both units repaired.

For the record, the Whidden AirPair 200 failed back in April. However, this link was barely functional due to what we've assumed was a misaligned radio on JFK. Of course, we can't realign the JFK radio until we get the Whidden end repaired.

The JFK site has historically been one of the most important backbone sites in PSnet (and CIMS), with five backbone links to Somerville PD, Everett Whidden, Revere Broadway Tower, Winthrop PD, and 35 Northampton. However, of these five backbone links, only two (Somerville PD and 35 Northampton) are currently working. We believe that the link to Winthrop PD can be repaired by replacing what we're hoping is just a bad power supply. However, this link needs to be re-aligned. Fortunately, the trees that were blocking the Winthrop end have now been trimmed back, so we can proceed with this alignment. With the links to Whidden and Broadway Tower out, we really do need the link to Winthrop restored ASAP.

I should also point out that we've been working with LAN-TEL to be able to decommission the three camera backhaul links that are currently on JFK. This should be accomplished in the near future.

Since we've anticipated that we may want to move off of the JFK site at some point, perhaps these backbone microwave failures and elimination of the camera backhaul links presents an opportunity to advance this objective.

I should also note that the FCC licenses for these two failed AirPair links are due to expire next August, and will have to be renewed if we want to continue using these links.

Strategically, we may want to consider investing in fiber links to the Northeast quadrant of MBHSR instead of repairing these failed links. If we can leverage fiber to the Commonwealth's data center at 200 Arlington in Chelsea, and MBTA fiber on the Blue Line to Beachmont station, then we would not need all of these long backbone microwave links, and we could better improve network resilience and survivability with shorter links between key facilities.

...Chuck

Subject: MBHSR THIRA Workshop - November 12

All,

You are invited to participate in the 2015 MBHSR Threat and Hazard Identification and Risk Assessment (THIRA) workshop on **Thursday, November 12 from 9:30am - 3:00pm at the Boston EOC (85 Bragdon Street, Roxbury 02119)**. Lunch will be provided.

The primary purpose of the workshop is to review and validate the Impacts, Capability Targets, and Resource Requirements for 18 Response- and Recovery-related Core Capabilities. Due to the updated 2015 THIRA guidance as well as the addition of a new scenario (Power Outage) there are aspects of the 2015 THIRA that have not yet been reviewed and will require specific attention from our SMEs. See the attached one-pager for the list of core capabilities requiring resource information as well as the threat/hazard scenarios.

I will send out a calendar invite following this email, and will provide additional details in the near future. In the meantime, contact me with questions.

Thanks,

Emma

Subject: PSnet: JFK <=> Winthrop PD link restored [was: Re: PSnet: Update on outage of Microwave link from Revere Broadway Tower to Boston JFK]

Attachment(s): "smime.p7s"

Folks,

This afternoon, Mark Savage with LAN-TEL replaced the power supply on the JFK radio that shoots to Winthrop PD, and this backbone link is now back up. This is particularly important, given the loss of both the AirPair at Whidden that shoots to JFK as well as the AirPair at Revere Broadway Tower that also shoots to JFK. With the JFK <=> Winthrop backbone link restored, we now have a much needed additional path into the northeast quadrant of MBHSR.

Furthermore, with the trees trimmed that were previously blocking the Winthrop PD radio from having unobstructed line-of-sight to JFK, we're seeing much better signal levels. We still need to work on re-aligning the JFK radio, but this link is working adequately and carrying traffic.

With Steven Ford's assistance, I removed the AirPair radio on Broadway Tower on Monday, and I plan to see if we can get both AirPair radios repaired. As soon as I have quotes, I'll provide some budgetary estimates on the cost to restore these two links. If the cost is high, we may propose alternative approaches to achieving improved connectivity to the communities of Chelsea, Everett, Revere, and Winthrop. As an aside, I've now got an idea as to why these two radios might have failed. If I'm right, we may want to take some preventative measures with other AirPair radios we have deployed.

Folks,

As I reported back on October 2nd, we lost the DragonWave AirPair microwave radio at the Revere Broadway Tower site that shoots to the JFK Building in Boston. At the time, we had assumed this was a power supply failure, which has been a frequent problem with the DragonWave radios. However, Mark Savage went on site this morning, and found the power supply was not the problem. I worked with Mark remotely, and after several reconfigurations and tests, we concluded that the radio itself has failed. Consequently, we don't have a quick fix, and this is going to be a lot more expensive to repair. More on our options below, but first the consequences.

While the network has re-routed around this failed link, the primary concern is that Revere and Winthrop are only connected to the PSnet backbone via Soldier's Home. Should we lose the Soldiers' Home site, then Revere and Winthrop would become disconnected from the backbone. Another concern is that, with two other radio links into JFK down, we only have two active links (out of 5) that reach JFK, which is an important site in its own right.

The best near-term option for improving the situation is to restore the links from Winthrop PD and Whidden into JFK. This requires site work at JFK on both of the radios, plus we need to resolve the problem with foliage interference at Winthrop PD. If we can get these two links back on line, then the situation will be substantially improved, even without the link between JFK and Broadway Tower. We have been working toward making these repairs already, and we'll aim to accelerate this work.

Another option would be to go forward with putting in place a new link between Everett and the Revere Reservoir site. This has been planned as a way to provide a second path into Everett, where currently everything relies on the Whidden Hospital. Note, installing this link may be comparable in cost to repairing the failed DragonWave AirPair.

I will continue to provide updates on this situation as we work toward mitigating the problems.

Scott,

Yes, these AirPairs are from the original (Phase 1) CIMS deployment. I believe they were originally installed in 2005. Eric is probably the better historian for pinning down the timeframe when these were deployed.

For everyone's edification, we use two models of DragonWave microwave radios in PSnet/CIMS. The DragonWave AirPairs were only deployed as part of the original CIMS installation, while the DragonWave Horizon radios were deployed in the 2009 timeframe since the AirPair models had been retired by that time. The primary visual difference between these two models is that the AirPairs have a separate "modem" or ODU that mounts on the same bracket as the antenna, and there is an IF cable from the ODU to the actual radio itself, which is mounted on the antenna. The Horizon models combine both the radio and modem into a single electronics package that is mounted on the back of the antenna. The Horizon models have also been retired by now, but the electronics packaging for current DragonWave models is similar, in that all electronics are combined into a single unit.

Subject: RE: PSnet: JFK <=> Winthrop PD link restored [was: Re: PSnet: Update on outage of Microwave link from Revere Broadway Tower to Boston JFK]

Thanks Chuck, that is what I thought, just wanted to confirm, I think we may need to have a plan, to use Cisms funds and Psnet funds to handle these problems.

The working together between the consultants , Interisle, LanTel and D5, is all working out extremely well, I think we have to make the funding for these types of repairs to be worked out by OEM working with Cisms abd Psnet committees , to split some of the costs between Cisms, and Psnet, neither budget should have to shoulder the entire cost, in my opinion.

Thanks ,

Scott

Importance: High

Scott,

Yes, these AirPairs are from the original (Phase 1) CIMS deployment. I believe they were originally installed in 2005. Eric is probably the better historian for pinning down the timeframe when these were deployed.

For everyone's edification, we use two models of DragonWave microwave radios in PSnet/CIMS. The DragonWave AirPairs were only deployed as part of the original CIMS installation, while the DragonWave Horizon radios were deployed in the 2009 timeframe since the AirPair models had been retired by that time. The primary visual difference between these two models is that the AirPairs have a separate "modem" or ODU that mounts on the same bracket as the antenna, and there is an IF cable from the ODU to the actual radio itself, which is mounted on the antenna. The Horizon models combine both the radio and modem into a single electronics package that is mounted on the back of the antenna. The Horizon models have also been retired by now, but the electronics packaging for current DragonWave models is similar, in that all electronics are combined into a single unit.

Thanks for getting this worked out.

Quick question, are these AirPair, original Cisms links, roughly how old are they?

Thanks,

Scott

Subject: PSnet: JFK <=> Winthrop PD link restored [was: Re: PSnet: Update on outage of Microwave link from Revere Broadway Tower to Boston JFK]

Importance: High

Folks,

This afternoon, Mark Savage with LAN-TEL replaced the power supply on the JFK radio that shoots to Winthrop PD, and this backbone link is now back up. This is particularly important, given the loss of both the AirPair at Whidden that shoots to JFK as well as the AirPair at Revere Broadway Tower that also shoots to JFK. With the JFK <=> Winthrop backbone link restored, we now have a much needed additional path into the northeast quadrant of MBHSR.

Furthermore, with the trees trimmed that were previously blocking the Winthrop PD radio from having unobstructed line-of-sight to JFK, we're seeing much better signal levels. We still need to work on re-aligning the JFK radio, but this link is working adequately and carrying traffic.

With Steven Ford's assistance, I removed the AirPair radio on Broadway Tower on Monday, and I plan to see if we can get both AirPair radios repaired. As soon as I have quotes, I'll provide some budgetary estimates on the cost to restore these two links. If the cost is high, we may propose alternative approaches to achieving improved connectivity to the communities of Chelsea, Everett, Revere, and Winthrop. As an aside, I've now got an idea as to why these two radios might have failed. If I'm right, we may want to take some preventative measures with other AirPair radios we have deployed.

Folks,

As I reported back on October 2nd, we lost the DragonWave AirPair microwave radio at the Revere Broadway Tower site that shoots to the JFK Building in Boston. At the time, we had assumed this was a power supply failure, which has been a frequent problem with the DragonWave radios. However, Mark Savage went on site this morning, and found the power supply was not the problem. I worked with Mark remotely, and after several reconfigurations and tests, we concluded that the radio itself has failed. Consequently, we don't have a quick fix, and this is going to be a lot more expensive to repair. More on our options below, but first the consequences.

While the network has re-routed around this failed link, the primary concern is that Revere and Winthrop are only connected to the PSnet backbone via Soldier's Home. Should we lose the Soldiers' Home site, then Revere and Winthrop would become disconnected from the backbone. Another concern is that, with two other radio links into JFK down, we only have two active links (out of 5) that reach JFK, which is an important site in its own right.

The best near-term option for improving the situation is to restore the links from Winthrop PD and Whidden into JFK. This requires site work at JFK on both of the radios, plus we need to resolve the problem with foliage interference at Winthrop PD. If we can get these two links back on line, then the situation will be substantially improved, even without the link between JFK and Broadway Tower. We have been working toward making these repairs already, and we'll aim to accelerate this work.

Another option would be to go forward with putting in place a new link between Everett and the Revere Reservoir site. This has been planned as a way to provide a second path into Everett, where currently everything relies on the Whidden Hospital. Note, installing this link may be comparable in cost to repairing the failed DragonWave AirPair.

I will continue to provide updates on this situation as we work toward mitigating the problems.

Subject: PSnet/CIMS: DragonWave AirPair Achilles' Heel | Immediate preventive measures needed

Attachment(s): "smime.p7s"

Eric, Mark, Dave, and Steven,

I want to bring to your immediate attention that we have discovered the Achilles' Heel of the DragonWave AirPair ODU's (RF modems). The front panel indicator lights are essentially holes drilled through the aluminum housing with a clear plastic cover to allow LEDs from the main logic board to shine through. Unfortunately, UV degradation of the plastic cover is letting water into the housing directly onto the main logic board. This is the reason that the AirPair radios at Whidden and Broadway Tower have failed.

I would like to ask any of you who are at one of our sites where the AirPairs are deployed to help take immediate action to weather seal the LED indicator portals (see photo below). This should prevent further damage. Silicon tape would probably be the best weather sealant, but clear silicon caulking should also work while allowing some visibility to the LEDs. Even friction tape would be a reasonable short-term measure. Note that we can generally work on these units without having to see the LEDs for status information.

The sites with AirPair ODU's include Whidden Hospital in Everett (1 unit, already removed), Broadway Tower in Revere (2 units, one removed), Soldiers' Home in Chelsea (1 unit), JFK Federal Building in Boston (3 units), 35 Northampton Boston (2 units), Eggleston Tower/Walnut Park in Roxbury (2 units), and Solomon Lewenberg School in Boston (1 unit).

Here is a photo showing the degraded clear plastic cover for the LED indicators on the Broadway Tower AirPair that Lt. Ford helped me take down earlier this week:

And here is what water has done to the main logic board for the AirPair that was at Revere Broadway Tower:

The above photo actually shows the LEDs that are mounted on the main logic board, and the water damage is visible to this entire area of the PC board. Of course, there was a major burn at some point when water created electrical pathways that the design engineers never intended. (I'm still trying to air out the stink of burned carbon and PCB resin from my "lab," and my significant other is not happy.)

Here is one more photo showing the interior of the AirPair ODU housing with the modem board removed to show the main logic board. At the bottom of the housing, there is a lot of water residue, so I think we can conclude this leak had been a problem for a long time before this board burned out.

I believe that taking the corrective actions I recommend above will help prevent further failures. However, I would also appreciate getting some help identifying the units that clearly have cracks or other openings in the LED plastic covers. These units should probably be removed and examined. Another test is to sniff at the LED portals to see if you smell any burnt electrical odors. If you do, then that AirPair is going to fail very soon.

To get an accurate quote from DragonWave to repair these AirPairs will require sending them back to the manufacturer. However, DragonWave support has indicated that an upper limit on the cost is \$2,000 per unit. This presumes that they have replacement logic boards, because this amount of damage cannot be repaired on the existing boards.

There's always something...

Hi Chuck. Thanks very much for this info. Could you give an estimate as to when the damaged radios were purchased and installed? Also, are they rated for outdoor use? If so it would seem to me, if they aren't that old, DragonWave should be held accountable for faulty products. What does a new DragonWave radio cost? Are there any alternatives to DragonWave? Thanks again for getting to the bottom of the problem with these radios.

Eric, Mark, Dave, and Steven,

I want to bring to your immediate attention that we have discovered the Achilles' Heel of the DragonWave AirPair ODUs (RF modems). The front panel indicator lights are essentially holes drilled through the aluminum housing with a clear plastic cover to allow LEDs from the main logic board to shine through. Unfortunately, UV degradation of the plastic cover is letting water into the housing directly onto the main logic board. This is the reason that the AirPair radios at Whidden and Broadway Tower have failed.

I would like to ask any of you who are at one of our sites where the AirPairs are deployed to help take immediate action to weather seal the LED indicator portals (see photo below). This should prevent further damage. Silicon tape would probably be the best weather sealant, but clear silicon caulking should also work while allowing some visibility to the LEDs. Even friction tape would be a reasonable short-term measure. Note that we can generally work on these units without having to see the LEDs for status information.

The sites with AirPair ODUs include Whidden Hospital in Everett (1 unit, already removed), Broadway Tower in Revere (2 units, one removed), Soldiers' Home in Chelsea (1 unit), JFK Federal Building in Boston (3 units), 35 Northampton Boston (2 units), Egleston Tower/Walnut Park in Roxbury (2 units), and Solomon Lewenberg School in Boston (1 unit).

Here is a photo showing the degraded clear plastic cover for the LED indicators on the Broadway Tower AirPair that Lt. Ford helped me take down earlier this week:

[cid:part1.06030402.05030201@Interisle.net]

And here is what water has done to the main logic board for the AirPair that was at Revere Broadway Tower:

[cid:part2.02090300.02070607@Interisle.net]

The above photo actually shows the LEDs that are mounted on the main logic board, and the water damage is visible to this entire area of the PC board. Of course, there was a major burn at some point when water created electrical pathways that the design engineers never intended. (I'm still trying to air out the stink of burned carbon and PCB resin from my "lab," and my significant other is not happy.)

Here is one more photo showing the interior of the AirPair ODU housing with the modem board removed to show the main logic board. At the bottom of the housing, there is a lot of water residue, so I think we can conclude this leak had been a problem for a long time before this board burned out.

[cid:part3.00020805.04010303@Interisle.net]

I believe that taking the corrective actions I recommend above will help prevent further failures. However, I would also appreciate getting some help identifying the units that clearly have cracks or other openings in the LED plastic covers. These units should probably be removed and examined. Another test is to sniff at the LED portals to see if you smell any burnt electrical odors. If you do, then that AirPair is going to fail very soon.

To get an accurate quote from DragonWave to repair these AirPairs will require sending them back to the manufacturer. However, DragonWave support has indicated that an upper limit on the cost is \$2,000 per unit. This presumes that they have replacement logic boards, because this amount of damage cannot be repaired on the existing boards.

There's always something...

...Chuck

Attachment(s): "smime.p7s"

Andrew,

All of the AirPairs were installed in 2005, so they've been in the field for ten years. The term "ODU" stands for "Outdoor Data Unit," so, yes, these are outdoor rated. The reason I've referred to this problem as an Achilles' Heel is that the physical enclosure is very robust--there are 26 screws that need to be removed to open up one of these units! However, one little problem with letting LED indicators show through this robust housing has wound up exposing the enclosure to water damage.

One thing to keep in mind is that these are licensed radio links, and so we have to stick with the frequencies we're licensed for. DragonWave is not the only vendor offering products in these frequency bands, but they're reasonably competent, and we know their products pretty well at this point. Also, repairing or replacing one radio is likely to be much cheaper than having to replace two radios. All of the vendors offering products that operate at these frequencies use proprietary encoding schemes, so it is not possible to mix and match between vendors. It is probably not even possible to mix and match between different model families from the same vendor, as there are constant refinements in the encoding and modulation techniques.

I do not know what current prices are for new radios capable of operating at our licensed frequencies. My guess is that we're looking at more than \$5,000 per radio (two per link). The original pricing for these radios, and the DragonWave Horizon Compacts that we also use, was north of \$10,000 per radio.

I plan to get better estimates of costs from DragonWave, and I'll review what other options might exist. When I've got more up-to-date information, I'll provide information on the options, and we'll make recommendations as to what would make the most sense.

Subject: RE: ShotSpotter (Chelsea, MA) - Camera integration testing

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVtel camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVtel system registered an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <10.112.0.0/16> on the ShotSpotter end and <10.20.61.0/24> on the PSnet end. Only addresses from the <10.112.0.0/16> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVtel camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVtel system registered an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Hi Lt. Griffin. I believe this can be addressed internally and does not need to involve Shotspotter as it's a DVtel configuration issue. Thanks very much.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a

public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <10.112.0.0/16> on the ShotSpotter end and <10.20.61.0/24> on the PSnet end. Only addresses from the <10.112.0.0/16> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <10.112.0.0/16> on the ShotSpotter end and <10.20.61.0/24> on the PSnet end. Only addresses from the <10.112.0.0/16> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVTEL camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVTEL system registered an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <[10.112.0.0/16](https://www.iana.org/assignments/iana-ipv4-special-assignments)> on the ShotSpotter end and <[10.20.61.0/24](https://www.iana.org/assignments/iana-ipv4-special-assignments)> on the PSnet end. Only addresses from the <[10.112.0.0/16](https://www.iana.org/assignments/iana-ipv4-special-assignments)> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Hi Lt. Griffin. I believe this can be addressed internally and does not need to involve Shotspotter as it's a DVtEl configuration issue. Thanks very much.

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVtEl camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVtEl system registered an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <[10.112.0.0/16](https://www.iana.org/assignments/iana-ipv4-special-assignments)> on the ShotSpotter end and <[10.20.61.0/24](https://www.iana.org/assignments/iana-ipv4-special-assignments)> on the PSnet end. Only addresses from the <[10.112.0.0/16](https://www.iana.org/assignments/iana-ipv4-special-assignments)> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Let. Griffin

I would like to further add (since Eric N is on the top of the Mystic power plant) We are also trying to achieve the shot spotter fix along with upgrading to 6.4 software . We do not want to waste efforts with fixing with the current 6.3 and have it not work when we upgrade . We are testing on house to make sure this is accomplished . I am sorry I did not update you sooner with this .

Respectfully ,

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVtel camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVtel system registered

an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <[10.112.0.0/16](#)> on the ShotSpotter end and <[10.20.61.0/24](#)> on the PSnet end. Only addresses from the <[10.112.0.0/16](#)> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Subject: Test Tomorrow?

Good Morning Ron,

Can we please schedule a test of the Chelsea PD Shot Spotter system for tomorrow afternoon? We will provide an address for targeting.

Thanks,

Eric

Hi Lt. Griffin. I believe this can be addressed internally and does not need to involve Shotspotter as it's a DVtel configuration issue. Thanks very much.

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVtel camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVtel system registered an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <10.112.0.0/16> on the ShotSpotter end and <10.20.61.0/24> on the PSnet end. Only addresses from the <10.112.0.0/16> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Hi Lt. Griffin. I believe this can be addressed internally and does not need to involve Shotspotter as it's a DVtel configuration issue. Thanks very much.

On Mon, Nov 2, 2015 at 1:57 PM, Griffin, Robert <RGriffin@chelseama.gov> wrote:

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVtel camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVtel system registered an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Hi Lt. Griffin,

No problem. Please inform your dispatch that we will be sending across a "Possible Gunshot" incident or two around 10:30AM PDT . I will reclassify them as "System Test" incidents after they have been sent by NE.

Thanks,

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <10.112.0.0/16> on the ShotSpotter end and <10.20.61.0/24> on the PSnet end. Only addresses from the <10.112.0.0/16> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Subject: PSnet/CIMS: Update on failed AirPair 200 ODUs; options to restore service

Attachment(s): "smime.p7s"

Folks,

After some back and forth with DragonWave, it has been determined that the two AirPair ODUs that failed cannot be repaired, and our only option to repair the two backbone links would be to order replacement ODUs. We have also been able to confirm that they do have two units in inventory that can be ordered (their inventory for this older product line is quite limited). The discounted price per unit is \$2,000, and they will not charge for the software license to operate these links at the rated 200 Mbps.

I recommend that we order the two replacement ODUs and restore these two backbone links as originally deployed. My analysis leading to this recommendation is presented below:

Aside: we also determined that these two failed units were from a small batch that shipped with what should have been temporary labels covering the LED view ports. Most units shipped with a thicker piece of plastic that has not suffered from the UV degradation that allowed water into these two units that failed. If you know what you're looking for, it is relatively easy to determine whether another unit has the correct label, or the thin deficient label. I'll provide some photos to LAN-TEL and D2Five so we can collectively determine whether we have other units with this same vulnerability.

Analysis of options and costs:

1. *Do we need to restore both links?*
 - Both links are not needed for capacity, but having both available does improve resilience and overall network survivability.
 - Without the Whidden <=> JFK link, the Whidden site is reliant upon two, somewhat circuitous paths via Chelsea and Somerville. The Chelsea link is a BridgeWave 80 GHz that is inherently quite susceptible to rain fade. The link to Somerville's Burton Faulkner site may be impacted by construction of a new high rise building at Assembly Square (we're watching this).
 - The Broadway Tower site is strategic in that it has a direct fiber link to the P25 "Reservoir" radio site at TF Carroll Way. Furthermore, since Revere PD and Broadway Tower are connected via Soldiers' Home, there is exposure to any problems at Soldiers' Home. Restoring Broadway Tower <=> JFK adds a second path to the backbone for Revere.
 - If we can only afford to replace one link, the best option would be to repair the Broadway Tower radio, and then accelerate plans to connect Everett to the Revere Reservoir site. (This would likely cost between \$5k to \$9k inclusive of equipment and labor.)
2. *Are there options to deploy new equipment, instead of repairing the old AirPair links?*
 - The primary constraint is that no newer equipment will interoperate with the older AirPair radios. This means we would need to replace both ends.
 - List pricing for current DragonWave 23 GHz models is approximately \$7,500 per pair, but we'd need to add ~ \$3,500 for software licensing to get to higher speeds, so a budgetary estimate for equipment only is \$11,000 per link. Installation costs would be anywhere from \$4k to \$8k. FCC licensing costs would need to be considered as well, but are relatively modest. Based on a quick survey of vendors, DragonWave is competitive with their pricing. (Aside: These prices are less than half what they were a few years ago.)
 - In theory, we could replace one link with new radios, and move one working AirPair ODU from JFK to the other site as a way to restore service to both links.
 - However, since any work on JFK is going to be expensive (involving certified tower climbers), the labor costs could easily exceed the cost of either replacing both AirPair ODUs at the other sites. Putting in a new link would also involve expensive labor costs at JFK. There would be some overlap with the work required to re-align the radios that shoot to Whidden and Winthrop, so this is not a straight comparison.
 - Strategically, we want to phase out the JFK site. Therefore, it makes sense to minimize any work we do at this site in the short term to just basic maintenance and re-alignments.
 - If we do put in a new link, then our strong recommendation would be to connect Soldiers' Home to the McCormack office building at 1 Ashburton, where we could tie into Loop A fiber. This would be the best option, but it is a more complex project that would involve multiple actors.
3. *Assuming we replace the failed AirPair ODUs, what are the other costs?*

- Physically replacing the ODUs that have already been removed (half the job) is fairly straight forward, and would require a couple of hours for one person. This entails remounting the ODU onto the existing bracket (easy), reconnecting the cables (easy), weather-proofing the cable connections (time consuming), and connecting into the lightning arrestor at each site (easy at Whidden, time consuming at Broadway Tower).
- It will also be necessary to configure the new ODU and test it out with the remote unit, and integrate into PSnet network management. This will require 1 - 3 hours per radio. There are a lot of parameters that need to be set and checked out.
- A reasonable budgetary estimate is four hours of labor per ODU replacement. However, I should note that labor has already been expended to remove these two ODUs, assess the failure, and explore the options with the vendor. A rough estimate is that we've already sunk at least eight hours so far into dealing with these problems, and I'm not counting the time that LAN-TEL spent confirming that the Broadway Tower ODU was not a simple power supply problem.
- Finally, we still need to re-align the AirPair radio at JFK that shoots to Whidden. We also need to re-align the DragonWave Horizon (new model) radio on JFK that shoots to Winthrop PD. It would be cost effective to do both jobs at the same time, but we'll need the Whidden ODU replaced before we can re-align its mate at JFK.

I hope I've addressed everyone's questions, but I can discuss any of these issues and options in further detail as necessary.

Please let me know how we should proceed.

...Chuck

We have also been able to confirm that they do have two units in inventory that can be ordered (their inventory for this older product line is quite limited). The discounted price per unit is \$2,000, and they will not charge for the software license to operate these links at the rated 200 Mbps.

I recommend that we order the two replacement ODUs and restore these two backbone links as originally deployed. My analysis leading to this recommendation is presented below:

Aside: we also determined that these two failed units were from a small batch that shipped with what should have been temporary labels covering the LED view ports. Most units shipped with a thicker piece of plastic that has not suffered from the UV degradation that allowed water into these two units that failed. If you know what you're looking for, it is relatively easy to determine whether another unit has the correct label, or the thin deficient label. I'll provide some photos to LAN-TEL and D2Five so we can collectively determine whether we have other units with this same vulnerability.

Analysis of options and costs:

1. *Do we need to restore both links?*

- Both links are not needed for capacity, but having both available does improve resilience and overall network survivability.
- Without the Whidden <=> JFK link, the Whidden site is reliant upon two, somewhat circuitous paths via Chelsea and Somerville. The Chelsea link is a BridgeWave 80 GHz that is inherently quite susceptible to rain fade. The link to Somerville's Burton Faulkner site may be impacted by construction of a new high rise building at Assembly Square (we're watching this).
- The Broadway Tower site is strategic in that it has a direct fiber link to the P25 "Reservoir" radio site at TF Carroll Way. Furthermore, since Revere PD and Broadway Tower are connected via Soldiers' Home, there is exposure to any problems at Soldiers' Home. Restoring Broadway Tower <=> JFK adds a second path to the backbone for Revere.
- If we can only afford to replace one link, the best option would be to repair the Broadway Tower radio, and then accelerate plans to connect Everett to the Revere Reservoir site. (This would likely cost between \$5k to \$9k inclusive of equipment and labor.)

2. *Are there options to deploy new equipment, instead of repairing the old AirPair links?*

- The primary constraint is that no newer equipment will interoperate with the older AirPair radios. This means we would need to replace both ends.
- List pricing for current DragonWave 23 GHz models is approximately \$7,500 per pair, but we'd need to add ~ \$3,500 for software licensing to get to higher speeds, so a budgetary estimate for equipment

only is \$11,000 per link. Installation costs would be anywhere from \$4k to \$8k. FCC licensing costs would need to be considered as well, but are relatively modest. Based on a quick survey of vendors, DragonWave is competitive with their pricing. (Aside: These prices are less than half what they were a few years ago.)

- In theory, we could replace one link with new radios, and move one working AirPair ODU from JFK to the other site as a way to restore service to both links.
 - However, since any work on JFK is going to be expensive (involving certified tower climbers), the labor costs could easily exceed the cost of either replacing both AirPair ODUs at the other sites. Putting in a new link would also involve expensive labor costs at JFK. There would be some overlap with the work required to re-align the radios that shoot to Whidden and Winthrop, so this is not a straight comparison.
 - Strategically, we want to phase out the JFK site. Therefore, it makes sense to minimize any work we do at this site in the short term to just basic maintenance and re-alignments.
 - If we do put in a new link, then our strong recommendation would be to connect Soldiers' Home to the McCormack office building at 1 Ashburton, where we could tie into Loop A fiber. This would be the best option, but it is a more complex project that would involve multiple actors.
3. *Assuming we replace the failed AirPair ODUs, what are the other costs?*
- Physically replacing the ODUs that have already been removed (half the job) is fairly straight forward, and would require a couple of hours for one person. This entails remounting the ODU onto the existing bracket (easy), reconnecting the cables (easy), weather-proofing the cable connections (time consuming), and connecting into the lightning arrestor at each site (easy at Whidden, time consuming at Broadway Tower).
 - It will also be necessary to configure the new ODU and test it out with the remote unit, and integrate into PSnet network management. This will require 1 - 3 hours per radio. There are a lot of parameters that need to be set and checked out.
 - A reasonable budgetary estimate is four hours of labor per ODU replacement. However, I should note that labor has already been expended to remove these two ODUs, assess the failure, and explore the options with the vendor. A rough estimate is that we've already sunk at least eight hours so far into dealing with these problems, and I'm not counting the time that LAN-TEL spent confirming that the Broadway Tower ODU was not a simple power supply problem.
 - Finally, we still need to re-align the AirPair radio at JFK that shoots to Whidden. We also need to re-align the DragonWave Horizon (new model) radio on JFK that shoots to Winthrop PD. It would be cost effective to do both jobs at the same time, but we'll need the Whidden ODU replaced before we can re-align its mate at JFK.

I hope I've addressed everyone's questions, but I can discuss any of these issues and options in further detail as necessary.

Please let me know how we should proceed.

Subject: RE: PSnet/CIMS: Update on failed AirPair 200 ODUs; options to restore service

Hi Chuck,

I think for quickness sake, go with the repair, we can figure out future options at another point in time, but for the time being, my recommendation is go for the repair now.

Thanks,
Scott

Subject: PSnet/CIMS: Update on failed AirPair 200 ODUs; options to restore service

Importance: High

Folks,

After some back and forth with DragonWave, it has been determined that the two AirPair ODUs that failed cannot be repaired, and our only option to repair the two backbone links would be to order replacement ODUs. We have also been able to confirm that they do have two units in inventory that can be ordered (their inventory for this older product line is quite limited). The discounted price per unit is \$2,000, and they will not charge for the software license to operate these links at the rated 200 Mbps.

I recommend that we order the two replacement ODUs and restore these two backbone links as originally deployed. My analysis leading to this recommendation is presented below:

Aside: we also determined that these two failed units were from a small batch that shipped with what should have been temporary labels covering the LED view ports. Most units shipped with a thicker piece of plastic that has not suffered from the UV degradation that allowed water into these two units that failed. If you know what you're looking for, it is relatively easy to determine whether another unit has the correct label, or the thin deficient label. I'll provide some photos to LAN-TEL and D2Five so we can collectively determine whether we have other units with this same vulnerability.

Analysis of options and costs:

1. *Do we need to restore both links?*

- Both links are not needed for capacity, but having both available does improve resilience and overall network survivability.
- Without the Whidden <=> JFK link, the Whidden site is reliant upon two, somewhat circuitous paths via Chelsea and Somerville. The Chelsea link is a BridgeWave 80 GHz that is inherently quite susceptible to rain fade. The link to Somerville's Burton Faulkner site may be impacted by construction of a new high rise building at Assembly Square (we're watching this).
- The Broadway Tower site is strategic in that it has a direct fiber link to the P25 "Reservoir" radio site at TF Carroll Way. Furthermore, since Revere PD and Broadway Tower are connected via Soldiers' Home, there is exposure to any problems at Soldiers' Home. Subject: Re: PSnet/CIMS: Update on failed AirPair 200 ODUs; options to restore service

Hi Chuck,

Your recommendation:

Folks,

After some back and forth with DragonWave, it has been determined that the two AirPair ODUs that failed cannot be repaired, and our only option to repair the two backbone links would be to order replacement ODUs. We have also been able to confirm that they do have two units in inventory that can be ordered (their inventory for this older product line is quite limited). The discounted price per unit is \$2,000, and they will not charge for the software license to operate these links at the rated 200 Mbps.

I recommend that we order the two replacement ODUs and restore these two backbone links as originally deployed. My analysis leading to this recommendation is presented below:

Aside: we also determined that these two failed units were from a small batch that shipped with what should have been temporary labels covering the LED view ports. Most units shipped with a thicker piece of plastic that has not suffered from the UV degradation that allowed water into these two units that failed. If you know what you're looking for, it is relatively easy to determine whether another unit has the correct label, or the thin deficient label. I'll provide some photos to LAN-TEL and D2Five so we can collectively determine whether we have other units with this same vulnerability.

Thank you for being so thorough and providing us with this information. After some discussion, we will take your recommendation and have the ODU's replaced given that this is a very critical issue.

thank you,
Eamon

On Tue, Nov 3, 2015 at 12:01 PM, Chuck Wade<Chuck@interisle.net> wrote:

Folks,

After some back and forth with DragonWave, it has been determined that the two AirPair ODUs that failed cannot be repaired, and our only option to repair the two backbone links would be to order replacement ODUs. We have also been able to confirm that they do have two units in inventory that can be ordered (their inventory for this older product line is quite limited). The discounted price per unit is \$2,000, and they will not charge for the software license to operate these links at the rated 200 Mbps.

I recommend that we order the two replacement ODUs and restore these two backbone links as originally deployed. My analysis leading to this recommendation is presented below:

Aside: we also determined that these two failed units were from a small batch that shipped with what should have been temporary labels covering the LED view ports. Most units shipped with a thicker piece of plastic that has not suffered from the UV degradation that allowed water into these two units that failed. If you know what you're looking for, it is relatively easy to determine whether another unit has the correct label, or the thin deficient label. I'll provide some photos to LAN-TEL and D2Five so we can collectively determine whether we have other units with this same vulnerability.

Analysis of options and costs:

1. *Do we need to restore both links?*

- Both links are not needed for capacity, but having both available does improve resilience and overall network survivability.
- Without the Whidden <=> JFK link, the Whidden site is reliant upon two, somewhat circuitous paths via Chelsea and Somerville. The Chelsea link is a BridgeWave 80 GHz that is inherently quite susceptible to rain fade. The link to Somerville's Burton Faulkner site may be impacted by construction of a new high rise building

- at Assembly Square (we're watching this).
- The Broadway Tower site is strategic in that it has a direct fiber link to the P25 "Reservoir" radio site at TF Carroll Way. Furthermore, since Revere PD and Broadway Tower are connected via Soldiers' Home, there is exposure to any problems at Soldiers' Home. Restoring Broadway Tower <=> JFK adds a second path to the backbone for Revere.
 - If we can only afford to replace one link, the best option would be to repair the Broadway Tower radio, and then accelerate plans to connect Everett to the Revere Reservoir site. (This would likely cost between \$5k to \$9k inclusive of equipment and labor.)
2. *Are there options to deploy new equipment, instead of repairing the old AirPair links?*
- The primary constraint is that no newer equipment will interoperate with the older AirPair radios. This means we would need to replace both ends.
 - List pricing for current DragonWave 23 GHz models is approximately \$7,500 per pair, but we'd need to add ~\$3,500 for software licensing to get to higher speeds, so a budgetary estimate for equipment only is \$11,000 per link. Installation costs would be anywhere from \$4k to \$8k. FCC licensing costs would need to be considered as well, but are relatively modest. Based on a quick survey of vendors, DragonWave is competitive with their pricing. (Aside: These prices are less than half what they were a few years ago.)
 - In theory, we could replace one link with new radios, and move one working AirPair ODU from JFK to the other site as a way to restore service to both links.
 - However, since any work on JFK is going to be expensive (involving certified tower climbers), the labor costs could easily exceed the cost of either replacing both AirPair ODUs at the other sites. Putting in a new link would also involve expensive labor costs at JFK. There would be some overlap with the work required to re-align the radios that shoot to Whidden and Winthrop, so this is not a straight comparison.
 - Strategically, we want to phase out the JFK site. Therefore, it makes sense to minimize any work we do at this site in the short term to just basic maintenance and re-alignments.
 - If we do put in a new link, then our strong recommendation would be to connect Soldiers' Home to the McCormack office building at 1 Ashburton, where we could tie into Loop A fiber. This would be the best option, but it is a more complex project that would involve multiple actors.
3. *Assuming we replace the failed AirPair ODUs, what are the other costs?*
- Physically replacing the ODUs that have already been removed (half the job) is fairly straight forward, and would require a couple of hours for one person. This entails remounting the ODU onto the existing bracket (easy), reconnecting the cables (easy), weather-proofing the cable connections (time consuming), and connecting into the lightning arrestor at each site (easy at Whidden, time consuming at Broadway Tower).
 - It will also be necessary to configure the new ODU and test it out with the remote unit, and integrate into PSnet network management. This will require 1 - 3 hours per radio. There are a lot of parameters that need to be set and checked out.
 - A reasonable budgetary estimate is four hours of labor per ODU replacement. However, I should note that labor has already been expended to remove these two ODUs, assess the failure, and explore the options with the vendor. A rough estimate is that we've already sunk at least eight hours so far into dealing with these problems, and I'm not counting the time that LAN-TEL spent confirming that the Broadway Tower ODU was not a simple power supply problem.
 - Finally, we still need to re-align the AirPair radio at JFK that shoots to Whidden. We also need to re-align the DragonWave Horizon (new model) radio on JFK that shoots to Winthrop PD. It would be cost effective to do both jobs at the same time, but we'll need the Whidden ODU replaced before we can re-align its mate at JFK.

I hope I've addressed everyone's questions, but I can discuss any of these issues and options in further detail as necessary.

Please let me know how we should proceed.

Attachment(s): "smime.p7s"

Eamon,

Thanks for getting back to me in such a timely manner. I will place the order with DragonWave tomorrow morning, and I hope to have these replacement units within a few business days. Since DragonWave is a Canadian company (as are many of the microwave manufacturers, including BridgeWave), there may be a delay as these are shipped through US and Canadian customs.

I'll provide further updates as we proceed with restoring service on these two backbone links.

Subject: PSnet: Identifying AirPair ODUs with LED view-port water vulnerabilities
Attachment(s): "smime.p7s"

Eric, Mark, Dave,

As I've learned, DragonWave apparently shipped a "few" AirPair ODUs with a label over the LED view ports that was not adequate, and subject to UV degradation that eventually allows water to enter the housing through the view ports. These labels were probably produced on a standard label printer, perhaps as a pilot production. Units should not have been shipped to the field with these deficient labels, but we managed to get at least two of these, which have now failed. Sadly, a review of my site photos indicates that most of the AirPair ODUs we have come with these defective labels.

This means we need to be aggressive about mitigating this exposure, ideally before the next rain comes. I will be making sure that Revere Broadway Tower and Chelsea Soldiers' Home AirPairs are dealt with this week. We'll need some help to get to the other sites in the near term. The most immediate concerns are with the 35 Northampton and Walnut Park/Egleston sites. The AirPair link between these two sites has been acting up lately, and this could be an indication that it is suffering from water damage. There is a lot of camera traffic going over this AirPair link, and it is an important path to Brookline.

Here is a summary of sites and AirPair links:

Site with AirPair Radio(s)	AirPair Radio Status		
JFK Federal Building, Boston	To Site	Label Status	Notes
	35 Northampton	Unknown	Probably replaced
	Whidden	Unknown	Probably replaced
	Broadway Tower	Unknown	Probably replaced
35 Northampton, Boston	To Site	Label Status	Notes
	JFK Federal Building	Bad	This is an AirPair Flex
	Walnut Park/Egleston	Bad	Originally from Whidden
Walnut Park/Egleston, Boston	To Site	Label Status	Notes
	35 Northampton	Bad	Originally from Soldiers' Home
	Young Achievers	OK	Original replaced
Young Achievers School, Boston (formerly Solomon Lewenberg)	To Site	Label Status	Notes
	Walnut Park/Egleston	OK	AirPair 50; original OK
Soldiers' Home, Chelsea	To Site	Label Status	Notes
	Broadway Tower	Bad	CW or DM to fix
Whidden Hospital, Everett	To Site	Label Status	Notes
	JFK Federal Building	Was bad	Failed ODU to be replaced
Broadway Tower, Revere	To Site	Label Status	Notes
	JFK Federal Building	Was bad	Failed ODU to be replaced
	Soldiers' Home	Bad	CW or SF to fix

Some notes on the above information:

1. A lightening strike at JFK took out the original AirPairs. I believe all of the ODUs were replaced, but a visual inspection is necessary. My photos pre-date the replacement/repair of these radios.
2. The AirPair link between 35 Northampton and Walnut Park was originally deployed between Soldiers' Home and Whidden Hospital. In 2009, this was replaced with a BridgeWave 80G link, and the AirPair radios were moved to Boston.
3. The AirPair link between Walnut Park and the Young Achievers School uses AirPair 50 models. It appears that these

models used the better labels. Furthermore, the unit at Walnut Park was replaced back in 2010 when it failed.

There is a fairly easy way to determine if a label is bad. If the middle (4th) LED is labeled "Interface Type" then it is most likely bad. If this same LED is labeled "Duplex" then the label is probably good. The bad labels also have a somewhat fuzzy appearance, whereas the good labels have a crisp appearance, even after weather exposure. The good labels are also visibly thicker than the bad labels, which are a thin sheet of plastic.

Here is a photo of a bad/deficient label (note the "Interface Type" description for the middle LED):

And here is a photo of a good label (note the "Duplex" description for the middle LED):

Finally, I hope to complete today the order to DragonWave for the replacement AirPair ODUs. I'm just waiting for them to acknowledge the order.

All,
 I guess the question I will ask is what recourse do we have with the vendor to make good on these faulty units?
 I think OEM, would need to be the lead on this , since the region was sold faulty units. Perhaps there is no recourse due to the age of the units??
 but we should put pressure on the manufacturer to make good.
 We are now dealing with more than just replacing 2 bad units, we have potentially many more that could cause major issues across Psnet and Cisms.

Eric, Mark, Dave,

As I've learned, DragonWave apparently shipped a "few" AirPair ODUs with a label over the LED view ports that was not adequate, and subject to UV degradation that eventually allows water to enter the housing through the view ports. These labels were probably produced on a standard label printer, perhaps as a pilot production. Units should not have been shipped to the field with these deficient labels, but we managed to get at least two of these, which have now failed. Sadly, a review of my site photos indicates that most of the AirPair ODUs we have came with these defective labels.

This means we need to be aggressive about mitigating this exposure, ideally before the next rain comes. I will be making sure that Revere Broadway Tower and Chelsea Soldiers' Home AirPairs are dealt with this week. We'll need some help to get to the other sites in the near term. The most immediate concerns are with the 35 Northampton and Walnut Park/Egleston sites. The AirPair link between these two sites has been acting up lately, and this could be an indication that it is suffering from water damage. There is a lot of camera traffic going over this AirPair link, and it is an important path to Brookline.

Here is a summary of sites and AirPair links:

Site with AirPair Radio(s)	AirPair Radio Status		
JFK Federal Building, Boston	To Site	Label Status	Notes
	35 Northampton	Unknown	Probably replaced
	Whidden	Unknown	Probably replaced
	Broadway Tower	Unknown	Probably replaced
35 Northampton, Boston	To Site	Label Status	Notes
	JFK Federal Building	Bad	This is an AirPair Flex
	Walnut Park/Egleston	Bad	Originally from Whidden
Walnut Park/Egleston, Boston	To Site	Label Status	Notes
	35 Northampton	Bad	Originally from Soldiers' Home
	Young Achievers	OK	Original replaced
Young Achievers School, Boston (formerly Solomon Lewenberg)	To Site	Label Status	Notes
	Walnut Park/Egleston	OK	AirPair 50; original OK
Soldiers' Home, Chelsea	To Site	Label Status	Notes

	Broadway Tower	Bad	CW or DM to fix
Whidden Hospital, Everett	To Site	Label Status	Notes
	JFK Federal Building	Was bad	Failed ODU to be replaced
Broadway Tower, Revere	To Site	Label Status	Notes
	JFK Federal Building	Was bad	Failed ODU to be replaced
	Soldiers' Home	Bad	CW or SF to fix

Some notes on the above information:

1. A lightening strike at JFK took out the original AirPairs. I believe all of the ODUs were replaced, but a visual inspection is necessary. My photos pre-date the replacement/repair of these radios.
2. The AirPair link between 35 Northampton and Walnut Park was originally deployed between Soldiers' Home and Whidden Hospital. In 2009, this was replaced with a BridgeWave 80G link, and the AirPair radios were moved to Boston.
3. The AirPair link between Walnut Park and the Young Achievers School uses AirPair 50 models. It appears that these models used the better labels. Furthermore, the unit at Walnut Park was replaced back in 2010 when it failed.

There is a fairly easy way to determine if a label is bad. If the middle (4th) LED is labeled "Interface Type" then it is most likely bad. If this same LED is labeled "Duplex" then the label is probably good. The bad labels also have a somewhat fuzzy appearance, whereas the good labels have a crisp appearance, even after weather exposure. The good labels are also visibly thicker than the bad labels, which are a thin sheet of plastic.

Here is a photo of a bad/deficient label (note the "Interface Type" description for the middle LED):

<hfjgida.>

And here is a photo of a good label (note the "Duplex" description for the middle LED):

<icjgfjhd.>

Finally, I hope to complete today the order to DragonWave for the replacement AirPair ODUs. I'm just waiting for them to acknowledge the order.

Hi Scott. I'm not sure we would be the primary on this. It depends on who purchased the radios but I believe, as you said, because of the age of the radios we may have no recourse. If we can find out who purchased them (us or a contractor like Interisle) we can look into options. Thanks.

I don't have an issue calling... if nothing else, I'll get to the bottom of their internal faults with their product placement.

Lord knows I have no problems with confronting a vendor to get results for the sake of my clients.

Let. Griffin

I would like to further add (since Eric N is on the top of the Mystic power plant) We are also trying to achieve the shot spotter fix along with upgrading to 6.4 software . We do not want to waste efforts with fixing with the current 6.3 and have it not work when we upgrade . We are testing on house to make sure this is accomplished . I am sorry I did not update you sooner with this .

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <[10.112.0.0/16](#)> on the ShotSpotter end and <[10.20.61.0/24](#)> on the PSnet end. Only addresses from the <[10.112.0.0/16](#)> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Let. Griffin

I would like to further add (since Eric N is on the top of the Mystic power plant) We are also trying to achieve the shot spotter fix along with upgrading to 6.4 software . We do not want to waste efforts with fixing with the current 6.3 and have it not work when we upgrade . We are testing on house to make sure this is accomplished . I am sorry I did not update you sooner with this .

Eric,

It's been almost a 3 weeks since our test. Have we made any progress on intergrating the ShotSpotter system with our DVtel camera system? We had 8 gunshots on 11/1/2015 at 1:27 AM. The DVtel system registered an alarm at that time and it appears the cameras moved. However, they returned to their presets with 8 seconds. Have we made any progress with adjusting the delay out to at least 10 minutes? Also, have we made any progress with getting the regular cameras to return to presets after 1 hour rather than 10 minutes?

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Christian,

Thanks for stepping in. As I think you've just demonstrated, there is no longer a problem. For the record, there had been an IP address change on the remote endpoint, which was the cause of the earlier problem. However, that's been resolved, and your ping test shows that the correct host is reachable.

As an aside, is there any way that your service could perform periodic tests of the connections to the Metro Boston endpoints? In other words, can you run a periodic ping against <10.20.61.77> and its ilk? As a reminder, we run a ping watchdog against your test host, <10.112.0.38>. If there's a better address for us to monitor, please let me know.

Regarding the "strange" traceroute results, this is due to the bi-directional NAT we have set up plus a portion of the internal connection goes through an MPLS network (BoNet). Step 14 in your traceroute is where you're inside the MPLS network, and several of the traceroute steps are entry and exit addresses for this MPLS network.

Subject: Re: ShotSpotter (Chelsea, MA) - Camera integration testing

Ron,

To be able to reach the Chelsea endpoint via its NAT'ed address of <10.20.61.77>, you need to be coming in via the IPsec tunnel from the ShotSpotter data center to the PSnet firewall. Your <209.10.80.38> address is a public-facing address, and is not even the address we have for the firewall at your end that terminates the IPsec tunnel.

For the record, the IPsec tunnel has SA addresses of <209.10.80.37> on the ShotSpotter end, and <75.144.154.34> for the PSnet firewall at Boston Police HQ. There is only one Phase 2 mapping, with <[10.112.0.0/16](#)> on the ShotSpotter end and <[10.20.61.0/24](#)> on the PSnet end. Only addresses from the <[10.112.0.0/16](#)> space will be able to traverse the tunnel from your end.

Feel free to call me if you want to discuss this further or conduct some real-time tests. I'm in my office.

Eric,

Currently, I am unable to reach the vms endpoint at 10.20.61.77 on port 1111 with a src ip of 209.10.80.38. Can you check your logs to see why we are getting refused and provision this ip in your firewall if you haven't already done so? Also, I haven't received an invite for our meeting tomorrow. Will you be sending that today?

Thanks,

Attachment(s): "smime.p7s"

Eric, Mark, Dave,

I plan to head out shortly to Walnut Park/Egleston, and then 35 Northampton to weather seal the AirPair ODUs at these two sites. I believe Dave has taken care of the ODU at Soldiers' Home. With the expected wind-driven rain, I think it prudent to get these sealed before we have any more failures.

If any of these AirPairs have already been weather sealed, please let me know.

Attachment(s): "smime.p7s"

Eric, Mark, Dave, et al.,

I was able to get some weather sealing on the AirPair ODUs at Walnut Park/Egleston and 35 Northampton today. The AirPair at Egleston that shoots to 35 Northampton had no plastic left covering its LED view ports, and was wide open to the elements. The other AirPair at that site (that shoots to Lewenberg/Young Achievers School) had the correct plastic label installed that adequately protects the LED view ports, and so was not a concern.

Getting to the roof of 35 Northampton was a real challenge with this building now under new management. Consequently, I was not able to get to these two AirPair ODUs until after dark. It seems that the labels covering the LED view ports were still intact, but I applied some weather protection anyway. As an aside, the AirPair that shoots to JFK has been acting up lately, so we'll need to see if we can determine the cause, as this is an important link. It was too dark to survey the physical path to JFK, which might be impacted by new construction.

Hopefully, we won't have any more AirPair failures with the heavy rain and wind forecasted for tomorrow.

While this was accomplished Eric N has also made template on the 6.4 upgrade for video to be displayed better on the slower police corporate networks. Since we beefed up the CIMS side the internal police networks are not unfortunately . I think we have won him over with going one on one and seeking his input

Subject: PSnet/CIMS: JFK to Whidden and JFK to Broadway Twr DragonWave AirPair ODUs replaced

Attachment(s): "smime.p7s"

Folks,

On Tuesday, with assistance from Dave Menzies, I was able to replace the DragonWave AirPair ODU's at our Whidden Hospital and Broadway Tower sites. Both radio links to the JFK site are now up after working through an odd issue with modem synchronization. However, there is a cabling problem at Broadway Tower that has the local data link down, and the receive levels for the JFK to Whidden link are poor, though this link is passing traffic now.

I hope to get back to the Broadway Tower site soon to resolve the cabling problem, at which point this link should be in excellent shape. Its receive levels are right on the spec for this distance.

The JFK to Whidden link requires re-aligning the radio antenna at the JFK end. This should restore receive levels to spec, and the expectation is that this link will then be solid.

...Chuck

DVTEL Inc. was acquired by FLIR Systems, Inc.

[View this email in your browser](#)

Date: Monday November 30th, 2015

Re: DVTEL Inc. was acquired by FLIR Systems, Inc.

Acquisition expands and enhances DVTEL's solution offering and market reach

Dear Partners and Customers;

We have announced today that DVTEL Inc. was acquired by FLIR Systems, Inc., the world leader in the design, development, manufacturing, marketing and distribution of sensor systems that enhance perception and awareness. (<http://www.flir.eu/home/> ; <http://www.flir.com/home/>). They bring innovative sensing solutions into daily life through thermal imaging systems, visible-light imaging systems, locator systems, measurement and diagnostic systems, and advanced threat detection systems.

Under the new FLIR ownership, all of you, our loyal **channel partners, system integrators, VARs and Distributors** will be able to offer a complete end-to-end video surveillance solution which will be integrated with FLIR's products and technologies, including top-of-the-line thermal imaging. DVTEL's high end Latitude VMS, mid-market Horizon and Meridian NVRs, cloud, hybrid and on premise products, will gain major exposure to the market through FLIR's extensive worldwide distribution.

We are truly excited to be joining FLIR, an organization known for its commitment to the creation of innovative and game-changing products. FLIR approached DVTEL after identifying our unique technology offering that has enabled our sustained growth and expansion over the last few years. We have worked with them closely and admire the impressive advancements they have made in thermal solutions for HLS, situational awareness and security sectors. We look forward to the next stage of our development.

DVTEL's teams globally, many of which you, being our **products' end-user**, know personally, have helped the company gain worldwide recognition from its inception as a start-up to a leading player in the industry, and have been loyal to you for many years. All of them will be joining FLIR to continue their relationship with you as well as advance the industry by combining forces with an excellent team that shares mutual culture and goals. With FLIR's highly innovative solutions, the joint offering is covering all market segments - from consumer to small business, mid-size corporations to large enterprises. This transaction is poised to be a significant one for both our partners and customers worldwide, as well as for the two companies alike."

Combined with DVTEL's existing high end and mid-range solutions, FLIR-branded thermal and visible cameras and its Lorex-branded security systems, the company is one of the largest video surveillance players in the industry today. Ziki Peled, our Chief Operating Officer, as well as substantially all of DVTEL's management and worldwide teams under him, are joining FLIR in managing our

business.

I wish you, DVTEL's loyal partners for many years, as well as FLIR's teams, your expanded partners' group, success, fruitful growth and mutual satisfaction.

About DVTEL

DVTEL is a leading developer of open-standard, end-to-end video surveillance solutions. DVTEL's advanced technology R&D department provides enterprise-grade integrated IP video networks available for small, mid-size and enterprise applications – that are scalable and share unified architecture. Solutions include high-performance, storageefficient HD IP cameras and video analytics for outdoor intrusion detection and tracking developed by DVTEL's research teams. DVTEL partners with leading industry players to deliver ONVIF-compliant solutions, provide high-quality services, develop custom applications, and seamlessly integrate third-party products to ensure interoperability and performance. DVTEL's installations provide field-proven expandability, flexibility and functionality in thousands of locations across five continents, while minimizing your investment and cost of ownership. None at all . Flir didn't have a VMS and it actually brings Dvtel capital. They actually found that Dvtel customer service is better so they are adopting the other way . I think that it will bring more customer base to Dvtel with Flir contacts

Acquisition expands and enhances DVTEL's solution offering and market reach

Dear Partners and Customers;
We have announced today that DVTEL Inc. was acquired by FLIR Systems, Inc., the world leader in the design, development, manufacturing, marketing and distribution of sensor systems that enhance perception and awareness. (<http://www.flir.eu/home/> ; <http://www.flir.com/home/>). They bring innovative sensing solutions into daily life through thermal imaging systems, visible-light imaging systems, locator systems, measurement and diagnostic systems, and advanced threat detection systems.

Under the new FLIR ownership, all of you, our loyal **channel partners, system integrators, VARs and Distributors** will be able to offer a complete end-to-end video surveillance solution which will be integrated with FLIR's products and technologies, including top-of-the-line thermal imaging. DVTEL's high end Latitude VMS, mid-market Horizon and Meridian NVRs, cloud, hybrid and on premise products, will gain major

exposure to the market through FLIR's extensive worldwide distribution.

We are truly excited to be joining FLIR, an organization known for its commitment to the creation of innovative and game-changing products. FLIR approached DVTEL after identifying our unique technology offering that has enabled our sustained growth and expansion over the last few years. We have worked with them closely and admire the impressive advancements they have made in thermal solutions for HLS, situational awareness and security sectors. We look forward to the next stage of our development.

DVTEL's teams globally, many of which you, being our **products' end-user**, know personally, have helped the company gain worldwide recognition from its inception as a start-up to a leading player in the industry, and have been loyal to you for many years. All of them will be joining FLIR to continue their relationship with you as well as advance the industry by combining forces with an excellent team that shares mutual culture and goals. With FLIR's highly innovative solutions, the joint offering is covering all market segments - from consumer to small business, mid-size corporations to large enterprises. This transaction is poised to be a significant one for both our partners and customers worldwide, as well as for the two companies alike."

Combined with DVTEL's existing high end and mid-range solutions, FLIR-branded thermal and visible cameras and its Lorex-branded security systems, the company is one of the largest video surveillance players in the industry today.

Ziki Peled, our Chief Operating Officer, as well as substantially all of DVTEL's management and worldwide teams under him, are joining FLIR in managing our business.

I wish you, DVTEL's loyal partners for many years, as well as FLIR's teams, your expanded partners' group, success, fruitful growth and mutual satisfaction.

Re: DVTEL Inc. was acquired by FLIR Systems, Inc.

Acquisition expands and enhances DVTEL's solution offering and market reach

Dear Partners and Customers;

We have announced today that DVTEL Inc. was acquired by FLIR Systems, Inc., the world leader in the design, development, manufacturing, marketing and distribution of sensor systems that enhance perception and awareness. (<http://www.flir.eu/home/> ; <http://www.flir.com/home/>). They bring innovative sensing solutions into daily life through thermal imaging systems, visible-light imaging systems, locator systems, measurement and diagnostic systems, and advanced threat detection systems.

Under the new FLIR ownership, all of you, our loyal **channel partners, system integrators, VARs and Distributors** will be able to offer a complete end-to-end video surveillance solution which will be integrated with FLIR's products and technologies, including top-of-the-line thermal imaging. DVTEL's high end Latitude VMS, mid-market Horizon and Meridian NVRs, cloud, hybrid and on premise products, will gain major exposure to the market through FLIR's extensive worldwide distribution.

We are truly excited to be joining FLIR, an organization known for its commitment to the creation of innovative and game-changing products. FLIR approached DVTEL after identifying our unique technology offering that has enabled our sustained growth and expansion over the last few years. We have worked with them closely and admire the impressive advancements they have made in thermal solutions for HLS, situational awareness and security sectors. We look forward to the next stage of our development.

DVTEL's teams globally, many of which you, being our **products' end-user**, know personally, have helped the company gain worldwide recognition from its inception as a start-up to a leading player in the industry, and have been loyal to you for many years. All of them will be joining FLIR to continue their relationship with you as well as advance the industry by combining forces with an excellent team that shares mutual culture and goals.

With FLIR's highly innovative solutions, the joint offering is covering all market segments - from consumer to small business, mid-size corporations to large enterprises. This transaction is poised to be a significant one for both our partners and customers worldwide, as well as for the two companies alike."

Combined with DVTEL's existing high end and mid-range solutions, FLIR-branded thermal and visible cameras and its Lorex-branded security systems, the company is one of the largest video surveillance players in the industry today.

Ziki Peled, our Chief Operating Officer, as well as substantially all of DVTEL's management and worldwide teams under him, are joining FLIR in managing our business.

I wish you, DVTEL's loyal partners for many years, as well as FLIR's teams, your expanded partners' group, success, fruitful growth and mutual satisfaction.

Subject: PSnet: Revere Broadway Tower radio repairs completed; other site maintenance

Attachment(s): "smime.p7s"

Folks,

Today, I was able to repair the data connection to the Broadway Tower recently replaced DragonWave AirPair radio that shoots to JFK. This link is now fully operational. This was due to a cabling problem that was a bit tricky to find.

In addition, I was able to restore management access to the AirPair radio at this site that shoots to Soldiers' Home. While this did not affect service, it did hamper our ability to monitor and manage this link. There's a similar problem with its companion radio at Soldiers' Home that I hope to resolve soon. Again, this is not affecting service, just management.

Finally, I dealt with another chore of updating the TrippLite firmware on the management cards that are associated with the redundant UPSs and PDU at this site. The latest firmware resolves a bunch of problems that I and others have reported. Unfortunately, the problems with the prior version of their firmware results in corruption of the TrippLite management card configuration and loss of access. If I had been able to access the PDU remotely as we intended, then I could have remotely restored the AirPair that shoots to Soldiers' Home, since this just required a power cycle.

The Broadway Tower site is now in excellent condition, with both microwave links up, plus the fiber to the City's fiber plant via the Reservoir site. With the service previously restored to the Winthrop PD to JFK microwave link, we now have three paths capable of connecting to the Reservoir P25 site.

...Chuck

This transaction is poised to be a significant one for both our partners and customers worldwide, as well as for the two companies alike."

Combined with DVTEL's existing high end and mid-range solutions, FLIR-branded thermal and visible cameras and its Lorex-branded security systems, the company is one of the largest video surveillance players in the industry today.

Ziki Peled, our Chief Operating Officer, as well as substantially all of DVTEL's management and worldwide teams under him, are joining FLIR in managing our business.

I wish you, DVTEL's loyal partners for many years, as well as FLIR's teams, your expanded partners' group, success, fruitful growth and mutual satisfaction.

About DVTEL

DVTEL is a leading developer of open-standard, end-to-end video surveillance solutions. DVTEL's advanced technology R&D department provides enterprise-grade integrated IP video networks available for small, mid-size and enterprise applications – that are scalable and share unified architecture. Solutions include high-performance, storage efficient HD IP cameras and video analytics for outdoor intrusion detection and tracking developed by DVTEL's research teams. DVTEL partners with leading industry players to deliver ONVIF-compliant solutions, provide high-quality services, develop custom applications, and seamlessly integrate third-party products to ensure interoperability and performance. DVTEL's installations provide field-proven expandability, flexibility and functionality in thousands of locations across five continents, while minimizing your investment and cost of ownership. Re: DVTEL Inc. was acquired by FLIR Systems, Inc.
Acquisition expands and enhances DVTEL's solution offering and market reach

Dear Partners and Customers;
We have announced today that DVTEL Inc. was acquired by FLIR Systems, Inc., the world leader in the design, development, manufacturing, marketing and distribution of sensor systems that enhance perception and awareness. (<http://www.flir.eu/home/> ; <http://www.flir.com/home/>). They bring innovative sensing solutions into daily life through thermal imaging systems, visible-light imaging systems, locator systems, measurement and diagnostic systems, and advanced threat detection systems.

Under the new FLIR ownership, all of you, our loyal **channel partners, system integrators, VARs** and **Distributors** will be able to offer a complete end-to-end video

surveillance solution which will be integrated with FLIR's products and technologies, including top-of-the-line thermal imaging. DVTEL's high end Latitude VMS, mid-market Horizon and Meridian NVRs, cloud, hybrid and on premise products, will gain major exposure to the market through FLIR's extensive worldwide distribution.

We are truly excited to be joining FLIR, an organization known for its commitment to the creation of innovative and game-changing products. FLIR approached DVTEL after identifying our unique technology offering that has enabled our sustained growth and expansion over the last few years. We have worked with them closely and admire the impressive advancements they have made in thermal solutions for HLS, situational awareness and security sectors. We look forward to the next stage of our development.

DVTEL's teams globally, many of which you, being our **products' end-user**, know personally, have helped the company gain worldwide recognition from its inception as a start-up to a leading player in the industry, and have been loyal to you for many years. All of them will be joining FLIR to continue their relationship with you as well as advance the industry by combining forces with an excellent team that shares mutual culture and goals. With FLIR's highly innovative solutions, the joint offering is covering all market segments - from consumer to small business, mid-size corporations to large enterprises. This transaction is poised to be a significant one for both our partners and customers worldwide, as well as for the two companies alike."

Combined with DVTEL's existing high end and mid-range solutions, FLIR-branded thermal and visible cameras and its Lorex-branded security systems, the company is one of the largest video surveillance players in the industry today.

But I want to make sure everyone is comfortable.... and address any concerns or questions.

This said I'd like to schedule a conference call where we can invite all the folks who want / need more details and have questions to ask high level management from FLIR directly on the this call.

Nothing bad here.... all very good... and I want to avoid any spin doctoring....

Can I work this call with you?

Thanks
MD

Subject: Mondays' Critical Infrastructure Meeting - Body camera presentation

Good Morning,

In addition to our regular topics at this meeting,

I also wanted to inform you, that at Monday's meeting at 1 pm at Brookline PD, Lantel & Hub Technologies will be doing a presentation on the body camera solution that they have developed.

Their solution will allow the UASI departments to use our existing CIMS infrastructure, DVTEL software and data storage components, etc.

If an agency is discussing moving to or exploring these devices, this would be a good segment to attend. It may make life a lot easier using a solution we have already invested in, and are comfortable working with as a body camera solution.

If anyone else from your department is interested in body cameras they are more than welcome to attend.

I just wanted to throw this out so everyone was aware of this presentation.

Have a good weekend, see you Monday,

Scott

Chief - see below

Guardian indoor shooter detection system

Point of Contact:
Eric Johnson-Lantel

I Benefits:
11000 installations worldwide

Low cost of entry

Small form factor acoustic and muzzle flash notification

No false positives less than 1% on technology

Developed by DARPA

triangulate the location of the nefarious actors to neutralize the subject

Gives accurate Geo info to LE on shooters in the situation less than 2 seconds notification to handheld device

Can be integrated with CAMERA system

24 yrs 45 Million in investment.

Very low integration needed PoE (power over Ethernet)

.22 calibre and up
tested

Local r&d

II Perceived Issues:

Cabling maybe an issue for city hall and older buildings

Initial threat is the entrance and security stations

Sensor is POE (cabling)

Qtrly maintenance is suggested \$\$\$

Clients:

BCEC
US ARMY Installations
Many others

III Next steps:

Eric Johnson would be able to detailed briefing if you have interest

Any questions let me know sir.

Chief - see below

Guardian indoor shooter detection system

Point of Contact:
Eric Johnson-Lantel

I Benefits:
11000 installations worldwide

Low cost of entry

Small form factor acoustic and muzzle flash notification

No false positives less than 1% on technology

Developed by DARPA

triangulate the location of the nefarious actors to neutralize the subject

Gives accurate Geo info to LE on shooters in the situation less than 2 seconds notification to handheld device

Can be integrated with CAMERA system

24 yrs 45 Million in investment.

Very low integration needed PoE (power over Ethernet)

.22 calibre and up
tested

Local r&d

II Perceived Issues:

Cabling maybe an issue for city hall and older buildings

Initial threat is the entrance and security stations

Sensor is POE (cabling)

Qtrly maintenance is suggested \$\$\$

Clients:

BCEC
US ARMY Installations
Many others

III Next steps:

Eric Johnson would be able to detailed briefing if you have interest

Any questions let me know sir.

Hey Mike,

Long time no speak I was at a conference yesterday for shot detection technologies and thought of your multil floored centers as well as bps.

I took these notes for another agency....with everything that has been going I thought your agency may want to look into some of these technologies.

If you have any questions or want more info let me know.

See you at our next snow storm.

Happy holidays,

Mike

Rick,

Good seeing you today at the EOC. I took these notes at conference I went to for SDS yesterday and hopefully they can help your department as you research different solutions.

See you at the next storm:)

Mike

Guardian Notes

Solution:
Guardian indoor shooter detection system

Point of Contact:
Eric Johnson-Lantel

Website: <http://www.shooterdetectionsystems.com/>

I Benefits:

Vetted solution, 11000 installations worldwide

Low cost of entry POE

Small form factor acoustic and muzzle flash notification

No false positives less than 1% on the technology

Developed by DARPA

Main benefit: Triangulate the location of active shooters so LE can effectively neutralize the threat

Gives accurate geo info to LE on shooters location in less than 2 seconds notification is pushed to any handheld device

Can be integrated with CAMERA system

24 yrs 45 Million in investment.

Very low integration needed Poe (power over Ethernet)

.22 calibre and up
sound tested

Local r&d (Rowley, MA)

II Perceived Issues:

Cabling maybe an issue for older buildings or multiple campuses

Initial threat is the entrance and security stations

Sensor is POE (cabling)

Qtrly maintenance is suggested \$\$\$

Clients:

BCEC

US ARMY Installations

Many others

III Next steps:

Eric Johnson of Lantel would be able to give a detailed briefing if you have interest

Any additional questions let me know

Mike

Andrew,

We've already received the advisory from Juniper, and we've been looking into this. PSnet does make extensive use of the Juniper Netscreen family of firewalls, and we run the firmware indicated as potentially affected. It is possible that our current practices for using firewalls has mitigated this threat somewhat. We'll provide an update when we've had a chance to fully assess the situation. Note that more information is expected from Juniper to help determine whether systems have been compromised.

Attachment(s): "smime.p7s"

Andrew, et al.,

Expanding further on my first response:

The fix provided by Juniper requires updating firmware on our SSG firewalls. This is a disruptive event, and we feel it is important to test the new firmware release for interoperability before we update all of our SSGs. In the meantime, I have implemented a configuration change that I believe will be effective in preventing exploitation of this vulnerability. The firmware has been installed on one SSG for testing, and we'll expand testing further this weekend.

Unfortunately, very little information has been provided by Juniper to date, so we lack sufficient knowledge to fully assess our risks associated with this recently reported vulnerability. All I can say at this time is that, while we *are* running vulnerable firmware on many (but not all) of our SSGs, we believe our current security practices make it unlikely that we are exposed. Furthermore, we have always employed independent logging and configuration management facilities that would make it very difficult to successfully attack our SSG firewalls without us noticing or at least having log records that could be used to determine if any attacks have been attempted. Specifically, we do not rely on the logs maintained within our SSG firewalls.

Also, so this does not get overlooked, the Motorola console proxy servers and other P25 system installations make use of Juniper SSG140 firewalls. However, from what I understand of how Motorola has configured these firewalls, I doubt that they would be exposed to this vulnerability. This would be an issue for Motorola to address, though.

I'll provide further updates as we progress with testing, and we'll let key stakeholders know when we plan to perform firmware upgrades.

Subject: RE: Juniper security issue

All,

If, any system was found to have this threat, is it possible, to discover what was – or could have been compromised, from the Juniper box forward?
I believe the State also uses Juniper, so could a threat from a non Psnet Juniper device, infiltrate into the Psnet network, into public safety systems?
In Brookline we have found, from the Town side that Munis, payroll systems uses juniper, as well as our traffic department connected to the RMV is over Juniper.
This could have a long domino effect with all these systems tied into each other.
If any system has one of these boxes, is there a way to track what systems where opened up, and what data could have been compromised?

Thanks
Scott

Subject: PSnet: Update on Juniper ScreenOS "unauthorized code" vulnerabilities and options to mitigate risks
Attachment(s): "smime.p7s"

Andrew, Scott,

After a lot of research and review of the situation with the recently announced out-of-cycle firmware updates for all Juniper ScreenOS-based products (SSG and ISG families), I can now offer a more complete assessment and put forward some recommendations for mitigating the risks associated with the vulnerabilities described in Juniper's notifications.

Because this is a complex topic that gets into a lot of technically dense material, I have provided an Executive Summary up front. I follow this up with a Threat Assessment, Threat Mitigation, and an outline of an Approach for upgrading PSnet's firewalls.

Executive Summary

At this time, it does not appear that PSnet Juniper SSG firewalls were exposed to the vulnerability announced by Juniper. However, we have taken some steps to further mitigate the risks, and we will take some additional measures in the coming days.

That said, best practices call for applying the firmware patches released by Juniper. Unfortunately, PSnet operates its Juniper SSG firewalls in a restricted mode known as "fips-mode," and this greatly complicates our ability to apply the firmware update. We will have to revert every firewall to its factory default state that will also clear all internal cryptographic keys. This will require quite a bit of effort, and will be disruptive to current operations. It will also require that we re-issue all PSnet public key certificates used for establishing encrypted (IPsec) tunnels used for inter-site communications in compliance with the FBI CJIS Security Policy.

This has not been a problem for PSnet in the past, but became an obstacle when Juniper re-issued their code signing cryptographic keys in August 2014. Juniper took this step due to a suspected compromise of their code signing private keys. While these keys can be installed with relative ease in Juniper firewalls that are not in "fips-mode," there is no means to install these keys in any SSG or ISG firewall operating in fips-mode. Without the new code signing keys, we can't authenticate the new firmware as valid, and hence we can't install it. The only way to resolve this impasse is to revert the SSG firewalls to factory defaults, clearing all internally generated private keys for each SSG.

Note, the reason that PSnet operates its Juniper SSG firewalls in "fips-mode" is that a strict interpretation of the FBI CJIS guidelines indicates that all devices involved with cryptographically-secured communications must be validated against the NIST FIPS-140-2 standard, and that such equipment should be operated in a manner consistent with the validation constraints. In the case of PSnet Juniper SSG firewalls, that means enabling "fips-mode." This results in a classic "Catch-22" situation.

We will have to develop a complete, step-by-step plan for rebuilding every SSG firewall from scratch, including re-issuing public key certificates, which can only be done after the SSGs are rebuilt from the factory reset. While our plan will attempt to reduce down time, it does not appear that we can avoid moderately severe service disruptions for any applications operating over PSnet encrypted tunnels, including the BRIC CrimeView and FATPOT applications, but also other services, such as the Sprint mobile communications for Chelsea. Some of PSnet's management services also rely on the encrypted tunnels maintained by the Juniper SSGs.

Threat Assessment

On December 17, Juniper disclosed a total of three vulnerabilities in two separate notifications, both distributed as "out of cycle" updates. One notification announced that there is a denial of service (i.e., crash) vulnerability in their most recent firmware release involving SSH authentication. This vulnerability does not affect PSnet SSGs since we are still operating on the prior code branch, and so we have not installed this latest firmware (nor could we easily, given the conflict with the new code signing keys and fips-mode).

The other notification disclosed two distinct vulnerabilities in all releases of the ScreenOS firmware for all SSG and ISG

products introduced since September 2012. Juniper has declared that these vulnerabilities were introduced as "*unauthorized code*" modifications, with the clear implication that code was planted in their software that was specifically designed to introduce these vulnerabilities. Their notification also announced availability of patched versions of all currently available ScreenOS firmware releases that remove the "unauthorized code."

All PSnet Juniper SSGs are running firmware releases that contain the unauthorized code, and hence have the vulnerabilities described in the Juniper notification. Aside, there was an earlier version of their notification that seemed to imply that only some of the PSnet SSGs included affected firmware, however a subsequent update corrected a typo to indicate that all versions in use within PSnet are affected.

The first vulnerability associated with the unauthorized code results in compromised authentication and access control methods used for establishing administrative access via the SSH protocol to Juniper's firewalls for command line access. This is effectively a "back door" into the firewall that provides an attacker with full privileges to change anything. Juniper has provided a means for detecting unauthorized access via SSH by reviewing log records, assuming these records were not subsequently removed by an attacker, which would be expected of an attacker using this back door. This vulnerability clearly represents a grave concern.

The other vulnerability introduced by the unauthorized code was described by Juniper as potentially allowing an attacker to decrypt encrypted traffic. However, Juniper provided no additional information on this vulnerability. Some security researchers have subsequently analyzed the differences between the prior code, and the new releases where the unauthorized code has been removed. This appears to indicate that a cryptographic parameter was modified, probably with the intent of weakening key generation for encrypted communications. Again, this is a matter of grave concern.

In order to assess risks to PSnet users and applications, we need to determine how feasible it is that either of these two introduced vulnerabilities could be used to attack PSnet firewalls or secure communications. I will first examine the SSH access control vulnerability. In this case, it is important to note that an attacker must be in a position to establish an SSH connection to a PSnet Juniper firewall. However, most PSnet firewalls are internal, and cannot be directly accessed from the public Internet. Only four PSnet Juniper firewalls have Internet-facing connections, and none of these will allow an SSH connection from their Internet interfaces. Furthermore, we constrain the Internet connections to a separate virtual router, so the barrier to overcoming our firewall protections is much higher than for a typical firewall. While it is always possible that implanted code could allow SSH connections for select users even when all other SSH access is disallowed, there is no indication that this is the case. In particular, this would require significant modifications to multiple internal code libraries, and such changes would have been easy for Juniper to spot long before now.

However, while SSH access from the public Internet is not allowed, we do allow SSH access from various internal subnets. Therefore, our primary concern is from attackers operating within the PSnet borders. This also introduces a concern raised by Scott that an attacker could successfully gain access to a non-PSnet Juniper firewall, and then use inside connections to get to PSnet firewalls. In this case, we believe we are largely protected, simply because we do not allow SSH access from other "private" networks we connect to. Furthermore, we use the virtual router scheme to further harden access from connected private networks. This still leaves us exposed to anyone who does have internal access to PSnet, and so we will be taking some further steps to restrict internal SSH access (see below for mitigation measures).

Regarding threats from attackers who might decrypt our private communications, the first point to note is that this requires someone to be able to intercept our encrypted communications. However, since nearly all of our encrypted traffic flows over PSnet, and not the public Internet nor any other external network, the bar is much higher for such an attack. While traffic intercepts could be deployed, these would require adding equipment and gaining physical access to PSnet circuits. This is certainly feasible, but it requires considerable motivation, non-trivial resources, and physical access, plus the attacker would have to know the means for exploiting whatever vulnerability was introduced into the cryptographic parameters.

Even if an attacker were able to intercept our encrypted tunnel traffic and decrypt this traffic, most of the sensitive applications (e.g., CrimeView, FATPOT) utilize end-to-end encryption, typically via the HTTPS protocol family. In other words, we're transporting encrypted application traffic inside of PSnet's encrypted tunnels.

Based on what we currently understand of these vulnerabilities, we have to rate the SSH back door as a moderate threat, though we believe PSnet systems are already hardened against this threat. The potential for exposing secure communications via the weakened crypto parameters appears to be a minor concern that we deem an unlikely threat.

Threat Mitigation

Based on our threat assessment, it is the SSH back door that we most need to mitigate as a threat. However, before discussing mitigation steps, let me note that we employ other practices that should help us detect past or future attacks leveraging this back door. The first of these practices is that we do send syslog records from our SSG firewalls to a central syslog server, where every record is stored and archived. This means we have the ability to scan prior log records to search for patterns that match the attack profile provided by Juniper. Since these log records are sent immediately with each event to our central syslog server, any attempt by an attacker to cover their tracks on the SSG they log into would be ineffective, since we have the same log records on another system. Of course, a truly sophisticated attacker could also compromise our syslog server, and remove evidence. This does raise the bar, though.

Another practice we've used for years is that we periodically (every hour) extract configuration files from all of our Juniper SSGs and deposit these into a source control repository. What this means is that the current configurations are constantly being compared to prior configurations, and any changes are reflected in the source control repository. Not only is this a very useful facility for tracking configuration changes, it also makes it more likely that we would detect unauthorized changes to our firewall configurations.

A third relevant practice is that Colin regularly audits our firewall logs for all Internet communications, both inbound and outbound. I review his audit reports, so two sets of eyes are on this. We compare current audit statistics against prior reports, and investigate any differences or aberrant behavior. The primary benefit so far to doing this is that we detect misconfigured systems operating within PSnet. We have also used these audits to recognize new ways to filter traffic that improves visibility and reduces potential exposures.

Yet another practice is that we have installed the public keys for administrators on every Juniper SSG, so that only users with the corresponding private keys can establish SSH connections. It is likely that this may limit the ability of an attacker to exploit the SSH back door, but we cannot fully assess this given the scant information provided so far by Juniper. It does help by causing any unauthorized access to send a different pattern of login authentication records than would be seen for legitimate access. Note that this same technique of pre-installed public keys is also used for the tool that periodically captures configurations.

The primary new step we have taken to mitigate the SSH back door threat has been to change the port number used for establishing SSH connections. This means that an attacker cannot use the standard port number (22), and would have to know the special port number we are using. While a scan could be done to find this custom port number, the scan itself would be a detectable event, and would be logged and likely blocked by the firewall. While this is a simple step, it has been proven to be an effective mitigation technique over decades of use. It works equally well for external and internal sources of attack, while minimizing any impact on operations since only 2 - 3 of us ever access the firewalls for administrative purposes anyway.

Another step we will be taking over the coming days is to further restrict administrative access to the SSG firewalls. The only administrative access methods are via SSH and a web GUI. However, the web GUI can only be accessed via encrypted tunnels, and access is tightly controlled. Since SSH access needs to only come from a few subnets, we will take measures to block SSH access from all other subnets. As previously noted, we already disallow SSH access from networks that PSnet connects to, such as police department networks. Two methods will be employed for blocking access, (1) firewall rules and (2) a separate mechanism for restricting administrative access to only select IP addresses.

Regarding the threats posed by potential eaves dropping on encrypted communications, we will explore whether there is any other sensitive information flowing over PSnet tunnels that is not already encrypted on an end-to-end basis. Should we find such situations, we will explore what could be done to enable end-to-end encryption. As noted above, CrimeView and FATPOT client-server communications already uses end-to-end communications, as does InterMapper client-server traffic. The Chelsea Sprint mobile traffic is also encrypted between Chelsea's mobiles and internal servers at Chelsea PD.

Finally, we will separately evaluate the encrypted tunnels established to Sprint and ShotSpotter, since both services use Juniper firewalls for establishing encrypted IPsec tunnels to PSnet. We will also evaluate other firewall connections to other agencies that use Juniper firewalls. This includes DCJIS, Boston PD, Cambridge PD, and the Motorola radio systems. However, given the constraints already imposed by PSnet on all of these connections (and vice versa), it seems unlikely that any of these end points could be vectors for attacks on PSnet. Similarly, these same constraints make it difficult for anyone to launch an attack from PSnet against other Juniper firewalls that touch PSnet.

Approach to Upgrading PSnet SSG firewalls to latest firmware

As noted in the Executive Summary, upgrading to the latest Juniper ScreenOS firmware on the PSnet SSGs is going to be a difficult and time-consuming project. Although we have a pretty good idea of what will be required to accomplish this, we cannot assess how much effort, how long it will take, or how disruptive this will be until we have developed a complete plan and run some exercises to assess real world aspects. There are various scenarios we might use, and we will have to determine which scenarios will be optimal. For example, it might be easiest to stage upgraded SSGs in a lab context, and perform a swap of the upgraded unit with the existing unit at each site. This could be less disruptive than performing in-place upgrades, though it might be more labor intensive.

Another issue is that, given the effort involved, we should use this as an opportunity to move to the current code branch for the ScreenOS firmware. Currently, PSnet SSGs are on the 6.2.0 code branch, but the current code branch is 6.3.0. The reason we have not already transitioned to the new code branch is that we have been unable to achieve interoperability for our IPsec tunnels between SSGs running 6.2.0 and 6.3.0. Although the additional testing required to validate operations using the new code branch will add to the overall effort, it is recommended as it will improve future access to firmware upgrades.

One issue we will explore is whether we should discontinue use of "fips-mode." To be blunt, the FIPS 140 series of standards is quite old, is known to be ineffective, and NIST has stalled for almost a decade on moving to FIPS 140-3 to

address the many known deficiencies in the current FIPS 140-2 standard. Furthermore, products that are configured to be compliant with FIPS 140-2 are actually less secure for a variety of complex reasons, while also being brittle and difficult to support. In addition, it is my understanding that the CJIS firewalls deployed by EOPSS are not configured to be FIPS 140-2 compliant. Based on my experience, EOPSS has taken the preferred approach.

Finally, we may want to evaluate another alternative. Juniper has announced End-of-Life (EOL) for the entire ScreenOS firewall line. They have a new family of firewalls based on JunOS, though there are other vendors with offerings that might be better suited to our purposes. While an EOL declaration for most products is of limited concern, it is a more serious issue for firewalls and other security appliances due to the need for continued vendor support in the face of constant escalation of security threats.

Therefore, depending on budget and timeframes, we may want to consider making a transition to a replacement product set instead of just going through the process of upgrading firmware on the existing SSGs. Once we have a new firewall family selected, and we have the template configurations and deployment strategies worked out, the incremental effort might be modest to cut over to a new product set instead of merely upgrading the existing SSGs. On the other hand, qualifying and selecting a new firewall family and devising the configurations and deployment practices is a significant effort. But, if we're going to have to do this anyway at some point, then maybe it would be prudent to do this now.

Bottom line

At this point, it appears we do not need to rush into upgrading the PSnet SSGs. This is good, since performing the upgrade to latest firmware is going to be a major effort. However, we will have to take steps to harden PSnet SSGs in the face of these new threats and to minimize exposure to the vulnerabilities associated with the "unauthorized code" implanted in our currently deployed firmware. We will also need to take a more diligent approach to monitoring for potential attacks leveraging these vulnerabilities.

In addition, we will need to develop comprehensive plans for either upgrading the current SSG firewalls, or transitioning to a new family of firewalls within a reasonable timeframe. This probably means within the next two to three months. The plans will also have to detail anticipated effort and impact on operations.

This is not a great position to be in, but it is by no means dire. In fact, it does not appear that our current threat levels and associated risks have increased significantly as a result of these announcements from Juniper. The major concern is that there could be increasing risks as we go forward until we are able to either upgrade or replace our current PSnet firewalls.

I will certainly try to answer any questions, and we will provide further updates as our planning progresses or if we learn anything significant about the threat situation. Please note that Colin is also quite familiar with the SSG firewalls and our deployed configurations, so he can help answer questions should I tied up with other efforts.

...Chuck

Subject: PSnet: DragonWave link between MITC and EBHS restored to service

Attachment(s): "smime.p7s"

Folks,

I'm providing a status update on another microwave link that has been down for a while, but is now back up. In this case, I'm referring to the DragonWave Horizon 23 GHz licensed link between the Massachusetts Information Technology Center (MITC) at 200 Arlington Street in Chelsea and East Boston High School. However, there is also a parallel unlicensed microwave link (Ubiquiti NB5) that has been carrying the load, so this path has been up even though the primary microwave radio was down.

The reason for the radio failure was another bad power supply. I replaced this power supply, and then reseated the management interface on the radio itself to restore management access to the radio. The link is back up, and able to handle its full capacity of 400 Mbps. Aside, this is the only 400 Mbps DragonWave link in PSnet. This used to also be the primary Internet connection for EOPSS out of MITC, but they now use their fiber connection for Internet traffic.

Even though the traffic load is not as high as it used to be, this link between MITC and EBHS is very important for PSnet resilience and capacity. Because PSnet also has a BridgeWave microwave link between MITC and the Chelsea E911 facility at 45 Washington Avenue, there are two diverse paths out of MITC into the PSnet backbone. Since all of the CJIS applications that are delivered via PSnet depend on connectivity to MITC, resilience is important for this site.

At the same time, this path from the Chelsea EOC/E911 facility to MITC to EBHS provides a second path out of Chelsea. Before this path came online back in 2010, Chelsea was completely reliant on its connection to Soldiers' Home for any regional communications. There have even been occasions when Chelsea cameras that connect back via Soldiers' Home were re-routed over the PSnet backbone to come in over the connection from EBHS via MITC.

...Chuck

Subject: PSnet: Repairs completed successfully at MITC today

Date: Mon, 21 Dec 2015 17:46:52 -0500

From: Chuck Wade <Chuck@Interisle.net>

Organization: Interisle Consulting Group, LLC

To: Michael Leary <Michael.Leary@MassMail.State.MA.US>

CC: Michael Janielis <Michael.Janielis@State.MA.US>, Sean Hughes <Sean.Hughes@State.MA.US>, Timothy Mitchell <Timothy.Mitchell@State.MA.US>, Robert Guerriero <Robert.Guerriero@State.MA.US>

Mike,

Thanks again for your help today in repairing the microwave link from your site to East Boston High School (EBHS). I replaced the power supply, and also fixed a loose cable connection for the management interface to this same microwave radio. The primary licensed microwave link is back online and passing traffic. The parallel unlicensed microwave link to EBHS had been carrying the load just fine, but now it is again the backup radio.

In doing this repair work, I also found a loose power connection for the microwave link into Chelsea, and this problem was also resolved.

Finally, thanks for letting me swap out the management card on the PSnet PDU. Now we don't have to worry that the vendor's firmware bug might kill the flash memory on another one of these cards.

Best wishes to all for a safe and quiet holiday, and a productive new year.

...Chuck

Subject: Re: PSnet: Update on Juniper ScreenOS "unauthorized code" vulnerabilities and options to mitigate risks

Attachment(s): "Juniper Networks - 2015-12 Out of Cycle Security Bulletin- ScreenOS- Multiple Security issues with ScreenOS (CVE-2015-7755, CVE-2015-7756) - Knowledge Base.pdf", "smime.p7s"

Folks,

I am following up with further information on the Juniper "unauthorized code" problem with new information that indicates a much lower risk profile for PSnet SSGs.

Security researchers were able to reverse engineer the Juniper code modifications, and from there, to discover that a special fixed password was implanted in recent versions of ScreenOS. This password was also disclosed. Since such disclosure (which was inevitable) potentially increased our risk profile, I started trying to test out attacks on lab SSG firewalls to determine if I could reproduce the problem. I was unable to do so, and at least one researcher (hdmoore) confirmed that this particular backdoor only applied to recent firmware releases on the 6.0.3 version fork. However, PSnet only uses firmware on the 6.2.0 fork.

Juniper subsequently re-issued their notification and confirmed that the SSH/Telnet back door vulnerability does not apply to the versions of firmware we are using. I have attached a pdf of Juniper's updated notice, but the relevant text is:

Administrative Access (CVE-2015-7755) allows unauthorized remote administrative access to the device. Exploitation of this vulnerability can lead to complete compromise of the affected device.

*This issue only affects ScreenOS 6.3.0r17 through 6.3.0r20. **No other Juniper products or versions of ScreenOS are affected by this issue.***

For the record, PSnet only uses 6.2.0r17 and 6.2.0r18 versions of firmware.

However, Juniper also confirmed that the other reported problem of a cryptographic weakness having been introduced that potentially allows decryption of encrypted VPN communications does still apply to the versions of firmware used by PSnet. Here is the text from Juniper:

VPN Decryption (CVE-2015-7756) may allow a knowledgeable attacker who can monitor VPN traffic to decrypt that traffic. It is independent of the first issue.

*This issue affects ScreenOS 6.2.0r15 through 6.2.0r18 and 6.3.0r12 through 6.3.0r20. **No other Juniper products or versions of ScreenOS are affected by this issue.***

Unfortunately, details about this second vulnerability are still scant. The full implications of this are not known outside of Juniper, and perhaps not even by them. Given my previous assessment of the threat this vulnerability represents, I continue to consider the actual risks to be slight, especially given that our sensitive applications already use end-to-end encryption inside of the encrypted tunnels maintained by PSnet SSG firewalls.

Colin and I have been continuing to review our SSG configurations and logs, and we will continue to take steps to harden access. We have also expanded the scope of our regular audits of firewall logs to consider additional sources of potential attacks. So far, we have not found anything that raises our concerns or triggers any alarms.

Bottom line: This is welcome news. As previously reported, significant effort would be required to upgrade to current firmware on all of the PSnet SSGs. It was the SSH backdoor that represented the greatest threat, and we have confirmed via our own testing, and Juniper's updated notice that this is no longer a concern for us.

As a final aside, I have purposely held off on providing this update so I could be assured that no additional evidence emerged today that would cause any further concerns. So far, no new news is good news in this case. Unless I've missed something, any new reporting on these issues has just been catching up on what has already been reported. I am also intentionally leaving out the various conjectures and conspiracy theories being bandied about regarding this unusual situation. Such speculation is interesting, and may well lead to further insights, but nothing has yet been confirmed.

...Chuck

On 12/21/15 12:33 AM, Chuck Wade wrote:

Andrew, Scott,

After a lot of research and review of the situation with the recently announced out-of-cycle firmware updates for all Juniper ScreenOS-based products (SSG and ISG families), I can now offer a more complete assessment and put forward some recommendations for mitigating the risks associated with the vulnerabilities described in Juniper's notifications.

Because this is a complex topic that gets into a lot of technically dense material, I have provided an Executive Summary up front. I follow this up with a Threat Assessment, Threat Mitigation, and an outline of an Approach for upgrading PSnet's firewalls.

Executive Summary

At this time, it does not appear that PSnet Juniper SSG firewalls were exposed to the vulnerability announced by Juniper. However, we have taken some steps to further mitigate the risks, and we will take some additional measures in the coming days.

That said, best practices call for applying the firmware patches released by Juniper. Unfortunately, PSnet operates its Juniper SSG firewalls in a restricted mode known as "fips-mode," and this greatly complicates our ability to apply the firmware update. We will have to revert every firewall to its factory default state that will also clear all internal cryptographic keys. This will require quite a bit of effort, and will be disruptive to current operations. It will also require that we re-issue all PSnet public key certificates used for establishing encrypted (IPsec) tunnels used for inter-site communications in compliance with the FBI CJIS Security Policy.

This has not been a problem for PSnet in the past, but became an obstacle when Juniper re-issued their code signing cryptographic keys in August 2014. Juniper took this step due to a suspected compromise of their code signing private keys. While these keys can be installed with relative ease in Juniper firewalls that are not in "fips-mode," there is no means to install these keys in any SSG or ISG firewall operating in fips-mode. Without the new code signing keys, we can't authenticate the new firmware as valid, and hence we can't install it. The only way to resolve this impasse is to revert the SSG firewalls to factory defaults, clearing all internally generated private keys for each SSG.

Note, the reason that PSnet operates its Juniper SSG firewalls in "fips-mode" is that a strict interpretation of the FBI CJIS guidelines indicates that all devices involved with cryptographically-secured communications must be validated against the NIST FIPS-140-2 standard, and that such equipment should be operated in a manner consistent with the validation constraints. In the case of PSnet Juniper SSG firewalls, that means enabling "fips-mode." This results in a classic "Catch-22" situation.

We will have to develop a complete, step-by-step plan for rebuilding every SSG firewall from scratch, including re-issuing public key certificates, which can only be done after the SSGs are rebuilt from the factory reset. While our plan will attempt to reduce down time, it does not appear that we can avoid moderately severe service disruptions for any applications operating over PSnet encrypted tunnels, including the BRIC CrimeView and FATPOT applications, but also other services, such as the Sprint mobile communications for Chelsea. Some of PSnet's management services also rely on the encrypted tunnels maintained by the Juniper SSGs.

Threat Assessment

On December 17, Juniper disclosed a total of three vulnerabilities in two separate notifications, both distributed as "out of cycle" updates. One notification announced that there is a denial of service (i.e., crash) vulnerability in their most recent firmware release involving SSH authentication. This vulnerability does not affect PSnet SSGs since we are still operating on the prior code branch, and so we have not installed this latest firmware (nor could we easily, given the conflict with the new code signing keys and fips-mode).

The other notification disclosed two distinct vulnerabilities in all releases of the ScreenOS firmware for all SSG and ISG products introduced since September 2012. Juniper has declared that these vulnerabilities were introduced as *"unauthorized code"* modifications, with the clear implication that code was planted in their software that was specifically designed to introduce these vulnerabilities. Their notification also announced

availability of patched versions of all currently available ScreenOS firmware releases that remove the "unauthorized code."

All PSnet Juniper SSGs are running firmware releases that contain the unauthorized code, and hence have the vulnerabilities described in the Juniper notification. Aside, there was an earlier version of their notification that seemed to imply that only some of the PSnet SSGs included affected firmware, however a subsequent update corrected a typo to indicate that all versions in use within PSnet are affected.

The first vulnerability associated with the unauthorized code results in compromised authentication and access control methods used for establishing administrative access via the SSH protocol to Juniper's firewalls for command line access. This is effectively a "back door" into the firewall that provides an attacker with full privileges to change anything. Juniper has provided a means for detecting unauthorized access via SSH by reviewing log records, assuming these records were not subsequently removed by an attacker, which would be expected of an attacker using this back door. This vulnerability clearly represents a grave concern.

The other vulnerability introduced by the unauthorized code was described by Juniper as potentially allowing an attacker to decrypt encrypted traffic. However, Juniper provided no additional information on this vulnerability. Some security researchers have subsequently analyzed the differences between the prior code, and the new releases where the unauthorized code has been removed. This appears to indicate that a cryptographic parameter was modified, probably with the intent of weakening key generation for encrypted communications. Again, this is a matter of grave concern.

In order to assess risks to PSnet users and applications, we need to determine how feasible it is that either of these two introduced vulnerabilities could be used to attack PSnet firewalls or secure communications. I will first examine the SSH access control vulnerability. In this case, it is important to note that an attacker must be in a position to establish an SSH connection to a PSnet Juniper firewall. However, most PSnet firewalls are internal, and cannot be directly accessed from the public Internet. Only four PSnet Juniper firewalls have Internet-facing connections, and none of these will allow an SSH connection from their Internet interfaces. Furthermore, we constrain the Internet connections to a separate virtual router, so the barrier to overcoming our firewall protections is much higher than for a typical firewall. While it is always possible that implanted code could allow SSH connections for select users even when all other SSH access is disallowed, there is no indication that this is the case. In particular, this would require significant modifications to multiple internal code libraries, and such changes would have been easy for Juniper to spot long before now.

However, while SSH access from the public Internet is not allowed, we do allow SSH access from various internal subnets. Therefore, our primary concern is from attackers operating within the PSnet borders. This also introduces a concern raised by Scott that an attacker could successfully gain access to a non-PSnet Juniper firewall, and then use inside connections to get to PSnet firewalls. In this case, we believe we are largely protected, simply because we do not allow SSH access from other "private" networks we connect to. Furthermore, we use the virtual router scheme to further harden access from connected private networks. This still leaves us exposed to anyone who does have internal access to PSnet, and so we will be taking some further steps to restrict internal SSH access (see below for mitigation measures).

Regarding threats from attackers who might decrypt our private communications, the first point to note is that this requires someone to be able to intercept our encrypted communications. However, since nearly all of our encrypted traffic flows over PSnet, and not the public Internet nor any other external network, the bar is much higher for such an attack. While traffic intercepts could be deployed, these would require adding equipment and gaining physical access to PSnet circuits. This is certainly feasible, but it requires considerable motivation, non-trivial resources, and physical access, plus the attacker would have to know the means for exploiting whatever vulnerability was introduced into the cryptographic parameters.

Even if an attacker were able to intercept our encrypted tunnel traffic and decrypt this traffic, most of the sensitive applications (e.g., CrimeView, FATPOT) utilize end-to-end encryption, typically via the HTTPS protocol family. In other words, we're transporting encrypted application traffic inside of PSnet's encrypted tunnels.

Based on what we currently understand of these vulnerabilities, we have to rate the SSH back door as a moderate threat, though we believe PSnet systems are already hardened against this threat. The potential for exposing secure communications via the weakened crypto parameters appears to be a minor concern that we deem an unlikely threat.

Threat Mitigation

Based on our threat assessment, it is the SSH back door that we most need to mitigate as a threat. However, before discussing mitigation steps, let me note that we employ other practices that should help us detect past or future attacks leveraging this back door. The first of these practices is that we do send syslog records from our SSG firewalls to a central syslog server, where every record is stored and archived. This means we have the ability to scan prior log records to search for patterns that match the attack profile provided by Juniper. Since

these log records are sent immediately with each event to our central syslog server, any attempt by an attacker to cover their tracks on the SSG they log into would be ineffective, since we have the same log records on another system. Of course, a truly sophisticated attacker could also compromise our syslog server, and remove evidence. This does raise the bar, though.

Another practice we've used for years is that we periodically (every hour) extract configuration files from all of our Juniper SSGs and deposit these into a source control repository. What this means is that the current configurations are constantly being compared to prior configurations, and any changes are reflected in the source control repository. Not only is this a very useful facility for tracking configuration changes, it also makes it more likely that we would detect unauthorized changes to our firewall configurations.

A third relevant practice is that Colin regularly audits our firewall logs for all Internet communications, both inbound and outbound. I review his audit reports, so two sets of eyes are on this. We compare current audit statistics against prior reports, and investigate any differences or aberrant behavior. The primary benefit so far to doing this is that we detect misconfigured systems operating within PSnet. We have also used these audits to recognize new ways to filter traffic that improves visibility and reduces potential exposures.

Yet another practice is that we have installed the public keys for administrators on every Juniper SSG, so that only users with the corresponding private keys can establish SSH connections. It is likely that this may limit the ability of an attacker to exploit the SSH back door, but we cannot fully assess this given the scant information provided so far by Juniper. It does help by causing any unauthorized access to send a different pattern of login authentication records than would be seen for legitimate access. Note that this same technique of pre-installed public keys is also used for the tool that periodically captures configurations.

The primary new step we have taken to mitigate the SSH back door threat has been to change the port number used for establishing SSH connections. This means that an attacker cannot use the standard port number (22), and would have to know the special port number we are using. While a scan could be done to find this custom port number, the scan itself would be a detectable event, and would be logged and likely blocked by the firewall. While this is a simple step, it has been proven to be an effective mitigation technique over decades of use. It works equally well for external and internal sources of attack, while minimizing any impact on operations since only 2 - 3 of us ever access the firewalls for administrative purposes anyway.

Another step we will be taking over the coming days is to further restrict administrative access to the SSG firewalls. The only administrative access methods are via SSH and a web GUI. However, the web GUI can only be accessed via encrypted tunnels, and access is tightly controlled. Since SSH access needs to only come from a few subnets, we will take measures to block SSH access from all other subnets. As previously noted, we already disallow SSH access from networks that PSnet connects to, such as police department networks. Two methods will be employed for blocking access, (1) firewall rules and (2) a separate mechanism for restricting administrative access to only select IP addresses.

Regarding the threats posed by potential eaves dropping on encrypted communications, we will explore whether there is any other sensitive information flowing over PSnet tunnels that is not already encrypted on an end-to-end basis. Should we find such situations, we will explore what could be done to enable end-to-end encryption. As noted above, CrimeView and FATPOT client-server communications already uses end-to-end communications, as does InterMapper client-server traffic. The Chelsea Sprint mobile traffic is also encrypted between Chelsea's mobiles and internal servers at Chelsea PD.

Finally, we will separately evaluate the encrypted tunnels established to Sprint and ShotSpotter, since both services use Juniper firewalls for establishing encrypted IPsec tunnels to PSnet. We will also evaluate other firewall connections to other agencies that use Juniper firewalls. This includes DCJIS, Boston PD, Cambridge PD, and the Motorola radio systems. However, given the constraints already imposed by PSnet on all of these connections (and vice versa), it seems unlikely that any of these end points could be vectors for attacks on PSnet. Similarly, these same constraints make it difficult for anyone to launch an attack from PSnet against other Juniper firewalls that touch PSnet.

Approach to Upgrading PSnet SSG firewalls to latest firmware

As noted in the Executive Summary, upgrading to the latest Juniper ScreenOS firmware on the PSnet SSGs is going to be a difficult and time-consuming project. Although we have a pretty good idea of what will be required to accomplish this, we cannot assess how much effort, how long it will take, or how disruptive this will be until we have developed a complete plan and run some exercises to assess real world aspects. There are various scenarios we might use, and we will have to determine which scenarios will be optimal. For example, it might be easiest to stage upgraded SSGs in a lab context, and perform a swap of the upgraded unit with the existing unit at each site. This could be less disruptive than performing in-place upgrades, though it might be more labor intensive.

Another issue is that, given the effort involved, we should use this as an opportunity to move to the current code

branch for the ScreenOS firmware. Currently, PSnet SSGs are on the 6.2.0 code branch, but the current code branch is 6.3.0. The reason we have not already transitioned to the new code branch is that we have been unable to achieve interoperability for our IPsec tunnels between SSGs running 6.2.0 and 6.3.0. Although the additional testing required to validate operations using the new code branch will add to the overall effort, it is recommended as it will improve future access to firmware upgrades.

One issue we will explore is whether we should discontinue use of "fips-mode." To be blunt, the FIPS 140 series of standards is quite old, is known to be ineffective, and NIST has stalled for almost a decade on moving to FIPS 140-3 to address the many known deficiencies in the current FIPS 140-2 standard. Furthermore, products that are configured to be compliant with FIPS 140-2 are actually less secure for a variety of complex reasons, while also being brittle and difficult to support. In addition, it is my understanding that the CJIS firewalls deployed by EOPSS are not configured to be FIPS 140-2 compliant. Based on my experience, EOPSS has taken the preferred approach.

Finally, we may want to evaluate another alternative. Juniper has announced End-of-Life (EOL) for the entire ScreenOS firewall line. They have a new family of firewalls based on JunOS, though there are other vendors with offerings that might be better suited to our purposes. While an EOL declaration for most products is of limited concern, it is a more serious issue for firewalls and other security appliances due to the need for continued vendor support in the face of constant escalation of security threats.

Therefore, depending on budget and timeframes, we may want to consider making a transition to a replacement product set instead of just going through the process of upgrading firmware on the existing SSGs. Once we have a new firewall family selected, and we have the template configurations and deployment strategies worked out, the incremental effort might be modest to cut over to a new product set instead of merely upgrading the existing SSGs. On the other hand, qualifying and selecting a new firewall family and devising the configurations and deployment practices is a significant effort. But, if we're going to have to do this anyway at some point, then maybe it would be prudent to do this now.

Bottom line

At this point, it appears we do not need to rush into upgrading the PSnet SSGs. This is good, since performing the upgrade to latest firmware is going to be a major effort. However, we will have to take steps to harden PSnet SSGs in the face of these new threats and to minimize exposure to the vulnerabilities associated with the "unauthorized code" implanted in our currently deployed firmware. We will also need to take a more diligent approach to monitoring for potential attacks leveraging these vulnerabilities.

In addition, we will need to develop comprehensive plans for either upgrading the current SSG firewalls, or transitioning to a new family of firewalls within a reasonable timeframe. This probably means within the next two to three months. The plans will also have to detail anticipated effort and impact on operations.

This is not a great position to be in, but it is by no means dire. In fact, it does not appear that our current threat levels and associated risks have increased significantly as a result of these announcements from Juniper. The major concern is that there could be increasing risks as we go forward until we are able to either upgrade or replace our current PSnet firewalls.

I will certainly try to answer any questions, and we will provide further updates as our planning progresses or if we learn anything significant about the threat situation. Please note that Colin is also quite familiar with the SSG firewalls and our deployed configurations, so he can help answer questions should I tied up with other efforts.

...Chuck

Subject: Re: PSnet: Update on Juniper ScreenOS "unauthorized code" vulnerabilities and options to mitigate risks
Importance: High

Folks,

I am following up with further information on the Juniper "unauthorized code" problem with new information that indicates a much lower risk profile for PSnet SSGs.

Security researchers were able to reverse engineer the Juniper code modifications, and from there, to discover that a special fixed password was implanted in recent versions of ScreenOS. This password was also disclosed. Since such disclosure (which was inevitable) potentially increased our risk profile, I started trying to test out attacks on lab SSG firewalls to determine if I could reproduce the problem. I was unable to do so, and at least one researcher (hdmoore) confirmed that this particular backdoor only applied to recent firmware releases on the 6.0.3 version fork. However, PSnet only uses firmware on the 6.2.0 fork.

Juniper subsequently re-issued their notification and confirmed that the SSH/Telnet back door vulnerability does not apply to the versions of firmware we are using. I have attached a pdf of Juniper's updated notice, but the relevant text is:

Administrative Access (CVE-2015-7755) allows unauthorized remote administrative access to the device. Exploitation of this vulnerability can lead to complete compromise of the affected device.
This issue only affects ScreenOS 6.3.0r17 through 6.3.0r20. No other Juniper products or versions of ScreenOS are affected by this issue.

For the record, PSnet only uses 6.2.0r17 and 6.2.0r18 versions of firmware.

However, Juniper also confirmed that the other reported problem of a cryptographic weakness having been introduced that potentially allows decryption of encrypted VPN communications does still apply to the versions of firmware used by PSnet. Here is the text from Juniper:

VPN Decryption (CVE-2015-7756) may allow a knowledgeable attacker who can monitor VPN traffic to decrypt that traffic. It is independent of the first issue.
This issue affects ScreenOS 6.2.0r15 through 6.2.0r18 and 6.3.0r12 through 6.3.0r20. No other Juniper products or versions of ScreenOS are affected by this issue.

Unfortunately, details about this second vulnerability are still scant. The full implications of this are not known outside of Juniper, and perhaps not even by them. Given my previous assessment of the threat this vulnerability represents, I continue to consider the actual risks to be slight, especially given that our sensitive applications already use end-to-end encryption inside of the encrypted tunnels maintained by PSnet SSG firewalls.

Colin and I have been continuing to review our SSG configurations and logs, and we will continue to take steps to harden access. We have also expanded the scope of our regular audits of firewall logs to consider additional sources of potential attacks. So far, we have not found anything that raises our concerns or triggers any alarms.

Bottom line: This is welcome news. As previously reported, significant effort would be required to upgrade to current firmware on all of the PSnet SSGs. It was the SSH backdoor that represented the greatest threat, and we have confirmed via our own testing, and Juniper's updated notice that this is no longer a concern for us.

As a final aside, I have purposely held off on providing this update so I could be assured that no additional evidence emerged today that would cause any further concerns. So far, no new news is good news in this case. Unless I've missed something, any new reporting on these issues has just been catching up on what has already been reported. I am also intentionally leaving out the various conjectures and conspiracy theories being bandied about regarding this unusual situation. Such speculation is interesting, and may well lead to further insights, but nothing has yet been confirmed.

On 12/21/15 12:33 AM, Chuck Wade wrote:

Andrew, Scott,

After a lot of research and review of the situation with the recently announced out-of-cycle firmware updates for all Juniper ScreenOS-based products (SSG and ISG families), I can now offer a more complete assessment and put forward some recommendations for mitigating the risks associated with the vulnerabilities described in Juniper's notifications.

Because this is a complex topic that gets into a lot of technically dense material, I have provided an Executive Summary up front. I follow this up with a Threat Assessment, Threat Mitigation, and an outline of an Approach for upgrading PSnet's firewalls.

Executive Summary

At this time, it does not appear that PSnet Juniper SSG firewalls were exposed to the vulnerability announced by Juniper. However, we have taken some steps to further mitigate the risks, and we will take some additional measures in the coming days.

That said, best practices call for applying the firmware patches released by Juniper. Unfortunately, PSnet operates its Juniper SSG firewalls in a restricted mode known as "fips-mode," and this greatly complicates our ability to apply the firmware update. We will have to revert every firewall to its factory default state that will also clear all internal cryptographic keys. This will require quite a bit of effort, and will be disruptive to current operations. It will also require that we re-issue all PSnet public key certificates used for establishing encrypted (IPsec) tunnels used for inter-site communications in compliance with the FBI CJIS Security Policy.

This has not been a problem for PSnet in the past, but became an obstacle when Juniper re-issued their code signing cryptographic keys in August 2014. Juniper took this step due to a suspected compromise of their code signing private keys. While these keys can be installed with relative ease in Juniper firewalls that are not in "fips-mode," there is no means to install these keys in any SSG or ISG firewall operating in fips-mode. Without the new code signing keys, we can't authenticate the new firmware as valid, and hence we can't install it. The only way to resolve this impasse is to revert the SSG firewalls to factory defaults, clearing all internally generated private keys for each SSG.

Note, the reason that PSnet operates its Juniper SSG firewalls in "fips-mode" is that a strict interpretation of the FBI CJIS guidelines indicates that all devices involved with cryptographically-secured communications must be validated against the NIST FIPS-140-2 standard, and that such equipment should be operated in a manner consistent with the validation constraints. In the case of PSnet Juniper SSG firewalls, that means enabling "fips-mode." This results in a classic "Catch-22" situation.

We will have to develop a complete, step-by-step plan for rebuilding every SSG firewall from scratch, including re-issuing public key certificates, which can only be done after the SSGs are rebuilt from the factory reset. While our plan will attempt to reduce down time, it does not appear that we can avoid moderately severe service disruptions for any applications operating over PSnet encrypted tunnels, including the BRIC CrimeView and FATPOT applications, but also other services, such as the Sprint mobile communications for Chelsea. Some of PSnet's management services also rely on the encrypted tunnels maintained by the Juniper SSGs.

Threat Assessment

On December 17, Juniper disclosed a total of three vulnerabilities in two separate notifications, both distributed as "out of cycle" updates. One notification announced that there is a denial of service (i.e., crash) vulnerability in their most recent firmware release involving SSH authentication. This vulnerability does not affect PSnet SSGs since we are still operating on the prior code branch, and so we have not installed this latest firmware (nor could we easily, given the conflict with the new code signing keys and fips-mode).

The other notification disclosed two distinct vulnerabilities in all releases of the ScreenOS firmware for all SSG and ISG products introduced since September 2012. Juniper has declared that these vulnerabilities were introduced as *"unauthorized code"* modifications, with the clear implication that code was planted in their software that was specifically designed to introduce these vulnerabilities. Their notification also announced availability of patched versions of all currently available ScreenOS firmware releases that remove the "unauthorized code."

All PSnet Juniper SSGs are running firmware releases that contain the unauthorized code, and hence have the vulnerabilities described in the Juniper notification. Aside, there was an earlier version of their notification that seemed to imply that only some of the PSnet SSGs included affected firmware, however a subsequent update corrected a typo to indicate that all versions in use within PSnet are affected.

The first vulnerability associated with the unauthorized code results in compromised authentication and access control methods used for establishing administrative access via the SSH protocol to Juniper's firewalls for command line access. This is effectively a "back door" into the firewall that provides an attacker with full privileges to change anything. Juniper has provided a means for detecting unauthorized access via SSH by reviewing log records, assuming these records were not subsequently removed by an attacker, which would be expected of an attacker using this back door. This vulnerability clearly represents a grave concern.

The other vulnerability introduced by the unauthorized code was described by Juniper as potentially allowing an attacker to decrypt encrypted traffic. However, Juniper provided no additional information on this vulnerability. Some security researchers have subsequently analyzed the differences between the prior code, and the new releases where the unauthorized code has been removed. This appears to indicate that a cryptographic parameter was modified, probably with the intent of weakening key generation for encrypted communications. Again, this is a matter of grave concern.

In order to assess risks to PSnet users and applications, we need to determine how feasible it is that either of these two introduced vulnerabilities could be used to attack PSnet firewalls or secure communications. I will first examine the SSH access control vulnerability. In this case, it is important to note that an attacker must be in a position to establish an SSH connection to a PSnet Juniper firewall. However, most PSnet firewalls are internal, and cannot be directly accessed from the public Internet. Only four PSnet Juniper firewalls have Internet-facing connections, and none of these will allow an SSH connection from their Internet interfaces. Furthermore, we constrain the Internet connections to a separate virtual router, so the barrier to overcoming our firewall protections is much higher than for a typical firewall. While it is always possible that implanted code could allow SSH connections for select users even when all other SSH access is disallowed, there is no indication that this is the case. In particular, this would require significant modifications to multiple internal code libraries, and such changes would have been easy for Juniper to spot long before now.

However, while SSH access from the public Internet is not allowed, we do allow SSH access from various internal subnets. Therefore, our primary concern is from attackers operating within the PSnet borders. This also introduces a concern raised by Scott that an attacker could successfully gain access to a non-PSnet Juniper firewall, and then use inside connections to get to PSnet firewalls. In this case, we believe we are largely protected, simply because we do not allow SSH access from other "private" networks we connect to. Furthermore, we use the virtual router scheme to further harden access from connected private networks. This still leaves us exposed to anyone who does have internal access to PSnet, and so we will be taking some further steps to restrict internal SSH access (see below for mitigation measures).

Regarding threats from attackers who might decrypt our private communications, the first point to note is that this requires someone to be able to intercept our encrypted communications. However, since nearly all of our encrypted traffic flows over PSnet, and not the public Internet nor any other external network, the bar is much higher for such an attack. While traffic intercepts could be deployed, these would require adding equipment and gaining physical access to PSnet circuits. This is certainly feasible, but it requires considerable motivation, non-trivial resources, and physical access, plus the attacker would have to know the means for exploiting whatever vulnerability was introduced into the cryptographic parameters.

Even if an attacker were able to intercept our encrypted tunnel traffic and decrypt this traffic, most of the sensitive applications (e.g., CrimeView, FATPOT) utilize end-to-end encryption, typically via the HTTPS protocol family. In other words, we're transporting encrypted application traffic inside of PSnet's encrypted tunnels.

Based on what we currently understand of these vulnerabilities, we have to rate the SSH back door as a moderate threat, though we believe PSnet systems are already hardened against this threat. The potential for exposing secure communications via the weakened crypto parameters appears to be a minor concern that we deem an unlikely threat.

Threat Mitigation

Based on our threat assessment, it is the SSH back door that we most need to mitigate as a threat. However, before discussing mitigation steps, let me note that we employ other practices that should help us detect past or future attacks leveraging this back door. The first of these practices is that we do send syslog records from our SSG firewalls to a central syslog server, where every record is stored and archived. This means we have the ability to scan prior log records to search for patterns that match the attack profile provided by Juniper. Since these log records are sent immediately with each event to our central syslog server, any attempt by an attacker to cover their tracks on the SSG they log into would be ineffective, since we have the same log records on another system. Of course, a truly sophisticated attacker could also compromise our syslog server, and remove evidence. This does raise the bar, though.

Another practice we've used for years is that we periodically (every hour) extract configuration files from all of our Juniper SSGs and deposit these into a source control repository. What this means is that the current configurations are constantly being compared to prior configurations, and any changes are reflected in the source control repository. Not only is this a very useful facility for tracking configuration changes, it also makes it more likely that we would detect unauthorized changes to our firewall configurations.

A third relevant practice is that Colin regularly audits our firewall logs for all Internet communications, both inbound and outbound. I review his audit reports, so two sets of eyes are on this. We compare current audit statistics against prior reports, and investigate any differences or aberrant behavior. The primary benefit so far to doing this is that we detect misconfigured systems operating within PSnet. We have also used these audits to recognize new ways to filter traffic that improves visibility and reduces potential exposures.

Yet another practice is that we have installed the public keys for administrators on every Juniper SSG, so that only users with the corresponding private keys can establish SSH connections. It is likely that this may limit the ability of an attacker to exploit the SSH back door, but we cannot fully assess this given the scant information provided so far by Juniper. It does help by causing any unauthorized access to send a different pattern of login authentication records than would be seen for legitimate access. Note that this same technique of pre-installed public keys is also used for the tool that periodically captures configurations.

The primary new step we have taken to mitigate the SSH back door threat has been to change the port number used for establishing SSH connections. This means that an attacker cannot use the standard port number (22), and would have to know the special port number we are using. While a scan could be done to find this custom port number, the scan itself would be a detectable event, and would be logged and likely blocked by the firewall. While this is a simple step, it has been proven to be an effective mitigation technique over decades of use. It works equally well for external and internal sources of attack, while minimizing any impact on operations since only 2 - 3 of us ever access the firewalls for administrative purposes anyway.

Another step we will be taking over the coming days is to further restrict administrative access to the SSG firewalls. The only administrative access methods are via SSH and a web GUI. However, the web GUI can only be accessed via encrypted tunnels, and access is tightly controlled. Since SSH access needs to only come from a few subnets, we will take measures to block SSH access from all other subnets. As previously noted, we already disallow SSH access from networks that PSnet connects to, such as police department networks. Two methods will be employed for blocking access, (1) firewall rules and (2) a separate mechanism for restricting administrative access to only select IP addresses.

Regarding the threats posed by potential eaves dropping on encrypted communications, we will explore whether there is any other sensitive information flowing over PSnet tunnels that is not already encrypted on an end-to-end basis. Should we find such situations, we will explore what could be done to enable end-to-end encryption. As noted above, CrimeView and FATPOT client-server communications already uses end-to-end communications, as does InterMapper client-server traffic. The Chelsea Sprint mobile traffic is also encrypted between Chelsea's mobiles and internal servers at Chelsea PD.

Finally, we will separately evaluate the encrypted tunnels established to Sprint and ShotSpotter, since both services use Juniper firewalls for establishing encrypted IPsec tunnels to PSnet. We will also evaluate other firewall connections to other agencies that use Juniper firewalls. This includes DCJIS, Boston PD, Cambridge PD, and the Motorola radio systems. However, given the constraints already imposed by PSnet on all of these connections (and vice versa), it seems unlikely that any of these end points could be vectors for attacks on PSnet. Similarly, these same constraints make it difficult for anyone to launch an attack from PSnet against other Juniper firewalls that touch PSnet.

Approach to Upgrading PSnet SSG firewalls to latest firmware

As noted in the Executive Summary, upgrading to the latest Juniper ScreenOS firmware on the PSnet SSGs is going to be a difficult and time-consuming project. Although we have a pretty good idea of what will be required to accomplish this, we cannot assess how much effort, how long it will take, or how disruptive this will be until we have developed a complete plan and run some exercises to assess real world aspects. There are various scenarios we might use, and we will have to determine which scenarios will be optimal. For example, it might be easiest to stage upgraded SSGs in a lab context, and perform a swap of the upgraded unit with the existing unit at each site. This could be less disruptive than performing in-place upgrades, though it might be more labor intensive.

Another issue is that, given the effort involved, we should use this as an opportunity to move to the current code branch for the ScreenOS firmware. Currently, PSnet SSGs are on the 6.2.0 code branch, but the current code branch is 6.3.0. The reason we have not already transitioned to the new code branch is that we have been unable to achieve interoperability for our IPsec tunnels between SSGs running 6.2.0 and 6.3.0. Although the additional testing required to validate operations using the new code branch will add to the overall effort, it is recommended as it will improve future access to firmware upgrades.

One issue we will explore is whether we should discontinue use of "fips-mode." To be blunt, the FIPS 140 series of standards is quite old, is known to be ineffective, and NIST has stalled for almost a decade on moving to FIPS 140-3 to address the many known deficiencies in the current FIPS 140-2 standard. Furthermore, products that are configured to be compliant with FIPS 140-2 are actually less secure for a variety of complex reasons, while also being brittle and difficult to support. In addition, it is my understanding that the CJIS firewalls deployed by EOPSS are not configured to be FIPS 140-2 compliant. Based on my experience, EOPSS has taken the preferred approach.

Finally, we may want to evaluate another alternative. Juniper has announced End-of-Life (EOL) for the entire ScreenOS firewall line. They have a new family of firewalls based on JunOS, though there are other vendors with offerings that might be better suited to our purposes. While an EOL declaration for most products is of limited concern, it is a more serious issue for firewalls and other security appliances due to the need for continued vendor support in the face of constant escalation of security threats.

Therefore, depending on budget and timeframes, we may want to consider making a transition to a replacement product set instead of just going through the process of upgrading firmware on the existing SSGs. Once we have a new firewall family selected, and we have the template configurations and deployment strategies worked out, the incremental effort might be modest to cut over to a new product set instead of merely upgrading the existing SSGS. On the other hand, qualifying and selecting a new firewall family and devising the configurations and deployment practices is a significant effort. But, if we're going to have to do this anyway at some point, then maybe it would be prudent to do this now.

Bottom line

At this point, it appears we do not need to rush into upgrading the PSnet SSGs. This is good, since performing the upgrade to latest firmware is going to be a major effort. However, we will have to take steps to harden PSnet SSGs in the face of these new threats and to minimize exposure to the vulnerabilities associated with the "unauthorized code" implanted in our currently deployed firmware. We will also need to take a more diligent approach to monitoring for potential attacks leveraging these vulnerabilities.

In addition, we will need to develop comprehensive plans for either upgrading the current SSG firewalls, or transitioning to a new family of firewalls within a reasonable timeframe. This probably means within the next two to three months. The plans will also have to detail anticipated effort and impact on operations.

This is not a great position to be in, but it is by no means dire. In fact, it does not appear that our current threat levels and associated risks have increased significantly as a result of these announcements from Juniper. The major concern is that there could be increasing risks as we go forward until we are able to either upgrade or replace our current PSnet firewalls.

I will certainly try to answer any questions, and we will provide further updates as our planning progresses or if we learn anything significant about the threat situation. Please note that Colin is also quite familiar with the SSG firewalls and our deployed configurations, so he can help answer questions should I be tied up with other efforts.

...Chuck

Andrew

I just wanted to share this email trail with you. I thought it was a bit bizarre since we did the upgrade quite sometime ago on the other cities and towns, and this is the first we are hearing of these issues on the other equipment (less the Everett FD server that we worked on the other day) it's odd that it seems that in beginning of email he wants information and be in the loop but at the end of the string there is no budget to do anything. So it's conflicting.

I would guess that "someone" was hoping I would forward upstream to send the message ?

Just keeping you in the loop.

Eric,

Please don't take this as me being flip, but we are unable to assist in these situations without more information. We have no insights as to what you're trying to do, or why this traffic is being generated in the first place. We do not know what [REDACTED], or why [REDACTED] is trying to communicate with it.

The essential point is that PSnet does not advertise any routes to the Everett PD LAN, and if we did, PSnet and the Everett Police Department would be in violation of FBI CJIS guidelines, as well as Commonwealth EOPSS security policies. In this case, the only IP addresses that the Archiver at Fire HQ should be communicating with via PSnet are in the [REDACTED] and [REDACTED] subnets. Reminder, the <..72.> addresses are associated with Whidden Hospital, while the <..73.> addresses are associated with Everett PD.

I suspect that the DVTEL server at Everett PD does have a connection to [REDACTED], though this connection should probably be through a firewall. However, the Archiver at Fire HQ needs some other means for reaching the Everett PD, and this mechanism **must** be encrypted to comply with FBI CJIS policies. However, if you're just trying to have the Archiver reach the DVTEL Server at PD, then that probably does not come under FBI policies.

When you get a chance, we would also like to review with you all of the other traffic from CIMS sources (ref. Colin's first table) going to unreachable destination addresses (ref. Colin's second table). Each of these attempts at communication to unreachable addresses probably represents some sort of misconfiguration that should be corrected. We can help identify the specific instances, but we lack sufficient insight into the CIMS installations to be able to precisely identify the misconfiguration. In all likelihood this dropped traffic is a result of recent CIMS upgrades, and may represent devices no longer in place, or devices that have been moved. I'll note that we occasionally have these issues with PSnet maintained equipment, but we can fix our problems when we find them.

Eric,

We recognized that you have a new server deployed at <10.0.72.201>. However, our point was that it, and other CIMS devices listed in the source table are attempting to communicate with IP addresses that either do not exist, or that are not reachable via PSnet.

In the example cited, <10.0.72.201> is attempting to communicate with <10.10.50.143>. That source address is probably intended for something on the Everett Police LAN, but there is no path via PSnet to that LAN, which is obviously restricted. The only paths we have to the Everett PD LAN are via encrypted tunnels to comply with FBI CJIS Security Policies.

Eric N.,

I am forwarding this note from Colin regarding a large increase in traffic from CIMS sources that could not be forwarded within PSnet. This results in these being sent to the default gateway for access to the Internet, where we drop this traffic and log these events.

It would help if we could get this "noise" reduced. This information may also be helpful to you in finding misconfigured servers and devices.

As an aside, we do regularly audit all Internet traffic, both outbound and inbound. We may subsequently reach out to you to investigate some other CIMS traffic that is traversing the Internet to confirm that this traffic is appropriate, and should be allowed.

Colin and I will be happy to address any questions or assist in debugging any of this dead-end traffic.

<colin@interisle.net>

One problem jumps out at me from last week's data, from the "usual" set of data I've been monitoring for months now.

SSG .16 Policy #6 (All CIMS, to RFC1918 et al., ANY service) had a very large increase in attempted accesses to invalid addresses. Previous weeks it has averaged less than 100k access attempts (which number is still far too high). This past week, there were over 1 million attempts.

There's too much data to be analyzed with Excel (so I cannot analyze the last ~16k items).
But 950k of those attempts came from a CIMS address (10.0.72.201) attempting to send nearly 1GB of data to 16 different UDP ports in the 8000-9000 range to the address 10.10.50.143, which, of course, we threw away.

Our InterMapper does not include that address – but I'll guess it's a mis-configured camera or video server.

Overall for this blocking policy shows that there are 38 separate addresses of devices that are misconfigured (or routing misconfigured) attempting to access RFC1918-style addresses:

10.0.66.53	10.0.67.114	10.0.67.6	10.0.71.105	10.0.72.100	10.0.72.140
10.0.72.141	10.0.72.143	10.0.72.145	10.0.72.201	10.0.72.46	10.0.72.48
10.0.72.52	10.0.72.54	10.0.72.59	10.0.72.62	10.0.73.109	10.0.73.110
10.0.73.111	10.0.73.123	10.0.73.124	10.0.73.48	10.0.73.52	10.0.73.54
10.0.73.56	10.0.73.58	10.0.74.151	10.0.77.110	10.0.77.140	10.0.77.143
10.0.77.153	10.0.77.155	10.0.77.165	10.0.77.166	10.0.77.198	10.0.77.209
10.0.77.221	10.0.77.250				

There were 9 separate destination addresses attempted for this policy:

10.10.50.143	172.16.10.161	172.16.10.181
172.16.10.252	192.168.0.1	192.168.0.255
192.168.1.102	192.168.13.105	192.168.7.59

Thanks Eric. Yes, I'm willing to bet Chuck is trying to make a point with this exchange but he is correct that he has a strict monthly budget. It is unfortunate though as LanTel consistently assists with PSnet issues.

What do you think is the best course of action? It's clearly a CIMS device but it's affecting PSnet with unnecessary traffic. Do you think Everett can offer any insight or assist in any way. How do we establish what's connected to [REDACTED] and re-route the traffic to the proper location?

Let me know if we can be of any assistance. Thanks.

Eric,

Please don't take this as me being flip, but we are unable to assist in these situations without more information. We have no insights as to what you're trying to do, or why this traffic is being generated in the first place. We do not know what <[REDACTED]> is, or why <[REDACTED]> is trying to communicate with it.

The essential point is that PSnet does not advertise any routes to the Everett PD LAN, and if we did, PSnet and the Everett Police Department would be in violation of FBI CJIS guidelines, as well as Commonwealth EOPSS security policies. In this case, the only IP addresses that the Archiver at Fire HQ should be communicating with via PSnet are in the <[REDACTED]> subnets. Reminder, the <..72.> addresses are associated with Whidden Hospital, while the <..73.> addresses are associated with Everett PD.

I suspect that the DVTEL server at Everett

PD does have a connection to [REDACTED] though this connection should probably be through a firewall. However, the Archiver at Fire HQ needs some other means for reaching the Everett PD, and this mechanism **must** be encrypted to comply with FBI CJIS policies. However, if you're just trying to have the Archiver reach the DVTEL Server at PD, then that probably does not come under FBI policies.

When you get a chance, we would also like to review with you all of the other traffic from CIMS sources (ref. Colin's first table) going to unreachable destination addresses (ref. Colin's second table). Each of these attempts at communication to unreachable addresses probably represents some sort of misconfiguration that should be corrected. We can help identify the specific instances, but we lack sufficient insight into the CIMS installations to be able to precisely identify the misconfiguration. In all likelihood this dropped traffic is a result of recent CIMS upgrades, and may represent devices no longer in place, or devices that have been moved. I'll note that we occasionally have these issues with PSnet maintained equipment, but we can fix our problems when we find them.

Eric,

We recognized that you have a new server deployed at [REDACTED] however, our point was that it, and other CIMS devices listed in the source table are attempting to communicate with IP addresses that either do not exist, or that are not reachable via PSnet.

In the example cited,
[REDACTED] is attempting to
communicate with
[REDACTED] That source
address is probably intended for
something on the Everett Police
LAN, but there is no path via
PSnet to that LAN, which is
obviously restricted. The only
paths we have to the Everett PD
LAN are via encrypted tunnels to
comply with FBI CJIS Security
Policies.

Subject: Fwd: Internet
access audit

Eric N.,

I am forwarding this note
from Colin regarding a
large increase in traffic
from CIMS sources that
could not be forwarded
within PSnet. This
results in these being
sent to the default
gateway for access to
the Internet, where we
drop this traffic and log
these events.

It would help if we could

get this "noise" reduced.
This information may
also be helpful to you in
finding misconfigured
servers and devices.

As an aside, we do
regularly audit all
Internet traffic, both
outbound and inbound.
We may subsequently
reach out to you to
investigate some other
CIMS traffic that is
traversing the Internet to
confirm that this traffic is
appropriate, and should
be allowed.

Colin and I will be happy
to address any
questions or assist in
debugging any of this
dead-end traffic.

...Chuck

One problem jumps out at me
from last week's data, from
the "usual" set of data I've
been monitoring for months
now.

SSG .16 Policy #6 (All CIMS,
to RFC1918 et al., ANY
service) had a very large
increase in attempted
accesses to invalid
addresses.
Previous weeks it has
averaged less than 100k
access attempts (which
number is still far too high).
This past week, there were
over 1 million attempts.

There's too much data to be
analyzed with Excel (so I
cannot analyze the last ~16k
items).
But 950k of those attempts
came from a CIMS address
(10.0.72.201) attempting to
send nearly 1GB of data to
16 different UDP ports in the
8000-9000 range to the
address 10.10.50.143, which,
of course, we threw away.

Our InterMapper does not
include that address – but I'll
guess it's a mis-configured
camera or video server.

Overall for this blocking policy shows that there are 38 separate addresses of devices that are misconfigured (or routing misconfigured) attempting to access RFC1918-style addresses:

There were 9 separate destination addresses attempted for this policy:

On Dec 29, 2015, at 12:28 PM, Chuck Wade <Chuck@Interisle.net> wrote:

Mike,

The [REDACTED] network is Everett Police. It is pretty clear that there is some issue with accessing the Archiver from Everett PD, and we suspect this is the reason for the UDP traffic going off into the ether and getting dropped by the PSnet Internet firewall. What is unusual in this case is that the traffic is being *sourced* from the Archiver at Fire HQ. Note that the DVTEL server at Everett PD is on the [REDACTED], whereas the Archiver is on <[10.2.2.10](#)> (due to the way that the CIMS network was originally deployed). [REDACTED]

The Archiver is able to communicate with the DVTEL server at the PD, and vice versa. Furthermore, we believe that users on the Everett PD LAN are able to communicate with their local DVTEL server, but there is no route from the Everett PD LAN to the Archiver at Fire HQ via PSnet, though Everett could use their own City network to provide access. Perhaps the new Archiver is missing a route that would direct traffic over a local path. As you've already noted, the Archiver has no routes to [REDACTED] yet such a route is necessary if it is going to communicate with the Everett PD LAN. Alternatively, Everett PD should be accessing the Archiver via their local DVTEL server. [REDACTED]

All we can do is observe that something is not working correctly, as we would not expect packets from the Archiver to be directed over PSnet to Everett PD. As I noted previously, the FBI CJIS policies do not allow us to provide unprotected access to a law enforcement network where criminal justice information resides.

There are certainly ways to achieve the services that Everett needs, but if this is going to be done via PSnet, then we need to actually engineer a solution, and we need to assure all parties that appropriate security practices are employed and that we comply with relevant policies. Note that this does not strictly require encryption, though we need to practice care in how the traffic flows, and what is contained in the traffic, as well as what end systems are involved.

Let me reiterate that our purpose in sharing this information with the CIMS team was to be helpful. We have information that something is not working correctly after a recent upgrade, and we wanted to let you know about our observations. We also appreciate it when the CIMS team lets us know about problems you guys observe. We try to watch your back, and we appreciate it when you watch our back.

Subject: RE: Internet access audit

Hi Mike,

Attached is an extract from this week's log from a Juniper SSG firewall which connects PSnet to the Internet.

I've "grep"ed the lines which apply to the specific firewall policy, and then "grep"ed the lines which include the address 10.0.72.201 so you only see those entries that are relevant to this particular address.

But let me back up and explain how this data is collected.

The Juniper SSG firewall is one of the places where PSnet connects to the Internet. One of the firewall policies (policy_id=6) checks to see if any messages are being sent to RFC1918-style addresses. (These addresses should never be sent to the Internet, as you know.)

If the checks match, the message is dropped (i.e., not sent to the Internet because it could not be delivered) but also logged.

Specifically, the log message is sent to a syslog server, where it is date/time stamped as well as identifying the source of the syslog message.

These log files are analyzed regularly.

Note that no harm is being caused by these messages; the log is merely reflecting information about packets received by the firewall that could not be delivered to their intended destination. We shared this information with you because you might be interested to know why it is occurring, especially if it could be causing unintended effects for applications.

Now all the firewall sees is a message with a source address (in this case 10.0.72.201) and an RFC-style destination address.

It is, presumably, possible for a system other than the one with that source address to spoof the source address. Possible, but I think it is unlikely.

If you look at the attached syslog extract, you'll see that the first 3,407 entries (from Dec 28 06:19:56 to Dec 28 08:04:17) show packets with a source address of 10.0.72.201 and a destination address of 10.10.50.143. Each is a UDP message directed at a variety of ports in the 8006-8938 range. Perhaps the pattern of port usage will provide some information as to the potential cause of these messages. The next 186 entries (from Dec 29 07:34:58 to Dec 29 08:00:14) are all ICMP type 8 requests – which probably reflects PING or TRACERT testing this morning.

In looking over the previous week's data, I note that the requests were not evenly spaced over the week. Here's the breakdown of requests by date for last week:

12/22/2015	949441
12/25/2015	679
12/26/2015	452

The requests started at 11:53:29 on Dec 22 and ended 21:44:21 that day.

They started again at 16:37:40 on Dec 25 and ended 15:37:55.

They started again at 01:46:51 on Dec 26 and ended at 1:47:16, then restarted at 21:19:31 and ended 21:19:46.

Again, this time pattern might help you understand the possible source of these requests.

I hope that this information will be useful for you, both to explain how we observed these traffic patterns and possibly to lead to a root cause for the generation of these

messages.

Regards,
colin

Subject: Re: Internet access audit

Chuck/Colin,

I spent some time today on the DVTEL server for Everett (10.0.72.201) to investigate the problems you outlined below. I am not sure how you are collecting your data and correlating it, but I have found ZERO evidence of this particular server reaching out and trying to connect to 10.10.50.143. This server has no static routes, it has two NIC cards one which is disabled and the other is assigned the 10.0.72.201 address that you claim is the heavy offender in your report below. As you can see this is the output from the routing table from that server:

```

Subject: BPD Upgrade Update

Attachment(s): "BPD to be completed.docx", "BPD upgrade completed.docx"

Andrew/ Deirdre:

Good evening,

Sorry for the delay, we were working on First Night prep and this upgrade project at City Hall.

I have attached two lists: One is for completed and to be completed .

I will not deny that it has been much slower in Boston since its more of a chess match then in the other CIMS towns that we have completed. BONET and spikes in crime are part of it. We started out replacing cameras in the Humboldt / Seaver St area due to the increase of crime. We held off on some antennas since we were told that the Walnut park hub was to be upgraded and existing equipment would have to be moved.

We shifted to the Dudley / Warren area since this has always been a complaint from the BRIC. We will be moving many antennas off the roof of 35 Northampton and really clean this up since these cameras and others in Phase 2 and 3 are associated with 35 Northampton St.

We then moved to around City Hall since these antennas were experiencing more than usual failures, we also wanted to get all on BONET before Officer Stancato's imminent retirement, and lastly set us up for Chuck Wades wishes to clean up the JFK roof since most of these were associated with this hub. In addition to this and it is not reflected on attachments, we have realigned the Ritz hub antenna from JFK as well, and with Chucks help have moved to The MIT building where there is fiber into the PSNET network.

I anticipate ramping up and finishing the cameras within the next 3 weeks and close out Phase 1.

On another note I can also report that all of the 200 cameras cameras in Boston were at 100 percent today.
(There are only 5 Cameras down across the whole network)

Have a Happy New Year !

Thanks
Eric

Andrew/ Deirdre:

Good evening,

Sorry for the delay, we were working on First Night prep and this upgrade project at City Hall.

I have attached two lists: One is for completed and to be completed .

I will not deny that it has been much slower in Boston since its more of a chess match then in the other CIMS towns that we have completed. BONET and spikes in crime are part of it. We started out replacing cameras in the Humboldt / Seaver St area due to the increase of crime. We held off on some antennas since we were told that the Walnut park hub was to be upgraded and existing equipment would have to be moved.

We shifted to the Dudley / Warren area since this has always been a complaint from the BRIC. We will be moving many antennas off the roof of 35 Northampton and really clean this up since these cameras and others in Phase 2 and 3 are associated with 35 Northampton St.

We then moved to around City Hall since these antennas were experiencing more than usual failures, we also wanted to get all on BONET before Officer Stancato's imminent retirement, and lastly set us up for Chuck Wades wishes to clean up the JFK roof since most of these were associated with this hub. In addition to this and it is not reflected on attachments, we have realigned the Ritz hub antenna from JFK as well, and with Chucks help have moved to The MIT building where there is fiber into the PSNET network.

I anticipate ramping up and finishing the cameras within the next 3 weeks and close out Phase 1.

On another note I can also report that all of the 200 cameras cameras in Boston were at 100 percent today.

(There are only 5 Cameras down across the whole network)

Have a Happy New Year !

Thanks

Eric

Subject: Camera Strategy Meeting - Notes and Action Items from Today's Meeting

Attachment(s): "Security Camera Strategy Meeting_1-20 Notes_ 01202016.docx"

Team - attached are the meeting notes from today's Camera Strategy meeting. Key items to note:

- 1.) VidSys representation is required.
- 2.) Meetings changed to bi-weekly (every other week) for now. (*We will meet weekly when planning for major events.*)
- 3.) Next meeting = Feb 3rd. Please plan to attend with your updates.

Please review the notes and let me know if there are any comments or corrections.

Thanks,

Subject: Access to Vidsys/CIMS at Boston Fire Alarm

Hello,

I was wondering if someone could let me know where we stand with this install of Vidsys/CIMS at Boston Fire Alarm office.

We could really use this access and would like to know what we can do to get this installed ASAP at Fire Alarm?

Is there something we need to do on our end?

I look forward to hearing from someone on this issue. I sent out an email on December 8th 2015 and didn't hear back from anyone, So I am trying again.

Thank you for all your time and help and look forward to getting this up and running.

Have a great day

Subject: Security Camera Strategy Status Meeting

Reminder: we are meeting today at 9:00am. Key points from last meeting are below:

Locations:

- Public Health - Jeff, Abhishek
 - o 203 River Street / EMS Storage Facility –VPN tunnel being completed. Next steps: confirm VPN tunnel; buy licensing (PO follow-up); create account; configuration & testing for validation. Cisco ASA firewall installed.
 - o Strand Theater – Axis-180 degree camera broken – location to be identified; camera to be replaced. Rich has 360 degree camera for trial use as replacement.
 - o ISD/1010 Mass Ave. – Bill Joyce to follow-up with Leon Graves and Joe Callahan on funding. Internal rewiring completed per Jerry. Callahan to split costs across tenants.
- City Hall New Camera Install – Waiting on funding and in-house techs. OEM will fund 39 cameras to replace existing analog cameras.
- VidSys – Connecting State and City VidSys servers:
 - o Interagency MOU – Shawn to provide MOU. Linda to coordinate MOU mtg.
 - o 2nd Vid Sys server buildout to connect to 45 High St/MBTA – In progress.
- MIT Lincoln Labs – Follow-up meeting BPD/MIT scheduled-Shawn.
- 85 Bragdon St. – Issue – can only access 24 of 32 VidSys panels – need to determine root cause Shawn/Mike working issues.
- Boston Housing Authority – Shawn to follow-up on with BPD legal. Insurance liability issue to be worked through for MOU. Next steps: Shawn/Linda to meet with Nicole Tom, BPD legal and Sully Mac to move this forward. (300 cameras, 34 facilities.)
- Canterbury Street, Public Works – Rich to follow-up on. (Comcast) (Warehouse for city lighting-theft & security issues); ties in with 1010 Mass Ave; waiting for electrical connectivity for cabling to the roof;
- Faneuil Hall – Ancient & Honorable – Mike/Rich did site survey and quote received. Will use existing 4 cameras.
- BFD – Headquarters and Fire alarm – Follow-up with BPD, BFD, PSNet, & COB for network connectivity and video sharing. Linda to provide Shawn with requirements email to follow-up with BPD and BFD. Linda to follow-up with Chuck Wade and Doug Schremp. Lantel switch at BPD HQ and need to link 10.240 network to 10.250 network; Jim Fitz, Chuck Wade and Brett are needed to make this connection.

II. Next Meeting: February 3rd, 2016 - 9:00-10:00AM,

Security Camera Strategy Status Meeting

Attached are the notes from last week's meeting for your reference. See you all tomorrow. We are back in the first floor conference room.

Subject: mike kane:VIDSYS

Per our discussion with VIDSYS today.

Our VIDSYS system with the current configuration has a maximum of 24 active panels which we are able to currently deliver at the EOC.

BPD will test our system the week of March 14 prior to our planned activation on 3/20.

BPD will also be actively monitoring our load capabilities during the activation to see if there are discrepancies. Any issues identified will be worked on and rectified prior to marathon.

Ian Thomas from VIDSYS may be onsite to assist.

Andrew/ Deirdre:

Good evening,

Sorry for the delay, we were working on First Night prep and this upgrade project at City Hall.

I have attached two lists: One is for completed and to be completed .

I will not deny that it has been much slower in Boston since its more of a chess match then in the other CIMS towns that we have completed. BONET and spikes in crime are part of it. We started out replacing cameras in the Humboldt / Seaver St area due to the increase of crime. We held off on some antennas since we were told that the Walnut park hub was to be upgraded and existing equipment would have to be moved.

We shifted to the Dudley / Warren area since this has always been a complaint from the BRIC. We will be moving many antennas off the roof of 35 Northampton and really clean this up since these cameras and others in Phase 2 and 3 are associated with 35 Northampton St.

We then moved to around City Hall since these antennas were experiencing more than usual failures, we also wanted to get all on BONET before Officer Stancato's imminent retirement, and lastly set us up for Chuck Wades wishes to clean up the JFK roof since most of these were associated with this hub. In addition to this and it is not reflected on attachments, we have realigned the Ritz hub antenna from JFK as well, and with Chucks help have moved to The MIT building where there is fiber into the PSNET network.

I anticipate ramping up and finishing the cameras within the next 3 weeks and close out Phase 1.

On another note I can also report that all of the 200 cameras cameras in Boston were at 100 percent today.
(There are only 5 Cameras down across the whole network)

Have a Happy New Year !

Thanks

Eric

Subject: FAC64 contract

Hi Kate. I'm noticing the current FAC64 contract expires end of May. I'm wondering if you have any plans to renew. Perhaps this process has already started. I'd like to amend our contract ASAP but need to make sure the State contract is squared away first. Thanks so much.

Andrew

Attachment(s): "FAC64 Contract Renewal.msg"

Hi Andrew,

As a follow up to my VM, I am attaching the email we received from Steve Lyons, the OSD FAC64 Procurement Manager, regarding the FAC64 renewal. This is the last information I received regarding the renewal. I am hopeful (and really, really hoping!) that the existing contract is renewed for two more years. I will let you know if I receive any additional updates. In the interim, feel free to reach out to Steve directly.

Let me know if there is anything else I can do at this point.

Regards,

Kate

Subject: FAC64 Contract Renewal

Hello

I am sending this email out to each vendor on FAC64. As you should be aware FAC64 will be up for renewal in May (currently expires 5/31/16). It is my intention to renew the contract for the next 2 years (6/1/16 – 5/31/18). Please provide me with any feedback you feel necessary: good comments, bad comments, ideas for improvement, obstacles for performance, etc. I will use this feedback as supporting arguments for why OSD should retain and renew FAC64.

If you have questions about this let me know. This is an informal request from me for general feedback. It does not need to be extensive and I would prefer a simple response by next week.

Thank you for your time and help.

-Steve

Thanks so much Kate. Do you happen to have a copy of your current contract documents? It's possible the State allows for us to utilize the existing FAC64 beyond its expiration date as long as ours is processed before that date. I'm trying to find out if this is true and I think it may be hidden somewhere in your contract terms and conditions. Thanks.

Andrew

We are performing tests with Revere , Chelsea , Somerville and Everett tomorrow . While contacting the SSpotter OIC he indicated that SS was going to change the way they are sending data packets . From what I see this change could affect the integration . I have learned from Dvtel that they were to be notified upon any change to the SS SDK . We have engaged Dvtel about this and they are working with SS to head off any impact or loss of integrity to the system

No worries. It's a bit complicated. Mike sits on the City's camera working group but I oversee the CIMS region-wide investment. Thanks so much Eric.

Subject: Oct and Nov billing questions
Attachment(s): "November 2015 Billing.xls", "October 2015 Billing.xls"

Hi Eric. I'm wondering if you could provide some clarification on two things we were billed for from October and November (see attached). Line 24 of the October sheet lists work due to construction damage. If something was damaged by construction we shouldn't be paying for it. Do we know what the damage was or who caused it?

On line 25 of the November sheet you list the install of an antenna. I just need to confirm this was the replacement of an antenna and not a new install. Thanks.

Andrew

On wardman we pieced together that were doing street work. We also found from the captain that the local gangs some times cut the wire too. we found line cut to camera locations . We attributed to the street work .

The antenna was not a new install. JFK to ritz was flaky . we reconfigured another antenna that we had in stock . Instead of putting back on JFK hub. We had the chance to move to MIT building rather than replace on JFK since fiber backbone is at MIT to Schroder plaza . Grand scheme is that We would like to wean off of JFK hub . Ultimately it was a replacement but just not at same location .

Subject: FAC64 Contract Renewal

Hello

I am sending this email out to each vendor on FAC64. As you should be aware FAC64 will be up for renewal in May (currently expires 5/31/16). It is my intention to renew the contract for the next 2 years (6/1/16 – 5/31/18). Please provide me with any feedback you feel necessary: good comments, bad comments, ideas for improvement, obstacles for performance, etc. I will use this feedback as supporting arguments for why OSD should retain and renew FAC64.

If you have questions about this let me know. This is an informal request from me for general feedback. It does not need to be extensive and I would prefer a simple response by next week.

Thank you for your time and help.

-Steve

Subject: Quote for Gunshot Detection

Hi John. I'm reach out to you on behalf of Chief Joyce at Boston City Hall and Rene Fielding, the Director of the Office of Emergency Management. We actually met when you did your demo at Brookline PD for body cameras. We'd love to bring you in to discuss the gunshot detection technology and how we can integrate it into current city hall security measures. However, I'm hoping you could provide a rough quote for the following first:

- installation of 3 cameras at 3 separate entrances to City Hall with the gunshot detection technology
- automatic employee desktop notifications
- automatic PD notifications

I may be missing a few items from this quote so if you could be as complete as possible and itemize the costs that would be excellent. Thanks very much.

Subject: MK: Security Camera Status OEM Update 2/17

Good Morning,

I will be dialing into the call this am.

- Quick update on Bragdon St, BPD upgraded our switch hardware at the EOC yesterday afternoon. No issues identified post installation. Thank you Shawn.
- Bragdon St will be doing a stress test with BPD on Monday 2/22 to see if this alleviated the bottleneck issues as well identify and any deficiencies for our planned March 17 activation.
- No updates on BFD Commissioner Finn Vidsys access or BFD fire alarm vidsys access.

Speak to you at 9am.

Subject: Re: FW: FAC64 contract

Hi Kate. Sorry, I should have let you know. This PO is for current funding on the current contract. I did speak to Steve and he said the contract would be renewed although he didn't mention a time frame. We have this \$130,829.23 on the PO you received plus an additional \$101,595.48 remaining on the City's existing contract. That should be more than enough to cover us until the new State contract is processed.

However, if possible, it would be great if at month's end you could provide an estimated invoice total so we can accurately track draw down and progress. Typically invoicing takes about a month on your end. I want to make sure there are no lapses in service due to inadequate funding on the contract side.

Let me know if you have any questions. Thanks so much.

We have this \$130,829.23 on the PO you received plus an additional \$101,595.48 remaining on the City's existing contract. That should be more than enough to cover us until the new State contract is processed.

However, if possible, it would be great if at month's end you could provide an estimated invoice total so we can accurately track draw down and progress. Typically invoicing takes about a month on your end. I want to make sure there are no lapses in service due to inadequate funding on the contract side.

Let me know if you have any questions. Thanks so much.

Andrew

Hi Andrew,

My apologies for just getting back to you on this; I was unavailable for the last several days. I just received a PO for the CIMS project in my email. Does that mean we are all set on this or would you like me to reach out to Steve?

Let me know what I can do to help.

Kate

Thanks so much Kate. Do you happen to have a copy of your current contract documents? It's possible the State allows for us to utilize the existing FAC64 beyond its expiration date as long as ours is processed before that date. I'm trying to find out if this is true and I think it may be hidden somewhere in your contract terms and conditions. Thanks.

Hi Andrew,

As a follow up to my VM, I am attaching the email we received from Steve Lyons, the OSD FAC64 Procurement Manager, regarding the FAC64 renewal. This is the last information I received regarding the renewal. I am hopeful (and really, really hoping!) that the existing contract is renewed for two more years. I will let you know if I receive any additional updates. In the interim, feel free to reach out to Steve directly.

Let me know if there is anything else I can do at this point.

Regards,

Kate

Subject: FAC64 contract

Hi Kate. I'm noticing the current FAC64 contract expires end of May. I'm wondering if you have any plans to renew. Perhaps this process has already started. I'd like to amend our contract ASAP but need to make sure the State contract is squared away first. Thanks so much.

Subject: FAC64 Contract Renewal

Hello

I am sending this email out to each vendor on FAC64. As you should be aware FAC64 will be up for renewal in May (currently expires 5/31/16). It is my intention to renew the contract for the next 2 years (6/1/16 – 5/31/18). Please provide me with any feedback you feel necessary: good comments, bad comments, ideas for improvement, obstacles for performance, etc. I will use this feedback as supporting arguments for why OSD should retain and renew FAC64.

If you have questions about this let me know. This is an informal request from me for general feedback. It does not need to be extensive and I would prefer a simple response by next week.

Thank you for your time and help.

-Steve

Subject: Quote for Gunshot Detection

Hi John. I'm reach out to you on behalf of Chief Joyce at Boston City Hall and Rene Fielding, the Director of the Office of Emergency Management. We actually met when you did your demo at Brookline PD for body cameras. We'd love to bring you in to discuss the gunshot detection technology and how we can integrate it into current city hall security measures. However, I'm hoping you could provide a rough quote for the following first:

- installation of 3 cameras at 3 separate entrances to City Hall with the gunshot detection technology
- automatic employee desktop notifications
- automatic PD notifications

I may be missing a few items from this quote so if you could be as complete as possible and itemize the costs that would be excellent. Thanks very much.

Subject: Fw: BONET Conversion
Attachment(s): "ATT00001.htm", "BONET CONVERSION BPD Upgrade - City Hall IPs.xlsx", "ATT00002.htm"

Andrew:

Here is the spreadsheet that we formulated requesting BONET IPs. You can see on email original email was sent in October. To date (with Vinnys help before he left). I have only received the City Hall IPs . When we originally quoted upgrade, I didn't think that this would be an issue. My dilemma is twofold; I am in between a political tennis match, and if I go and change out a camera, I have to revisit to change out IPs, and move switch ports etc. My plan was to have these antennas and paths in place, and seamlessly change over as we installed cameras , or pick a hub and just get it done all at once . I also know that over a month ago, Shawn Romo had a discussion with Rothman, and the plan was that an IP request would go in, and the turn around would be 48 hours, that has not happened . This is just my opinion, while the BONET scheme is the definite way to go , and everyone is cheerleading for BONET . There is a disconnect . I don't think DOIT is ready for these requests, or operates at the instantaneous level of the BPD. Or I could be totally wrong and they are just ignoring Romo. I think we have been patient, and we have followed the procedure that they put in place. (If the requests were forwarded) I believe we have given DOIT more than enough lead time to make this happen. Whatever the case may be, and I don't want to make waves , but clearly this is now impacting my performance. If we could push this along discreetly. I know that I can finally move along and finish.

Thanks,
Eric

Gentlemen,

As the DvTel crew begins upgrading our cameras and backhaul antennas based on OEM upgrade monies, I would like to start moving as many of these cameras into a Bonet backhaul at the same time.

The attached document lists the Bonet site and the number of IP Addresses required to bring in x number of cameras at each site.

The sites are listed in order of need as they update locations.

If you have questions reach out to me

Attachment(s): "BONET CONVERSION BPD Upgrade - City Hall IPs.xlsx"

Hi Linda,

I would like to add this item to our biweekly meeting hot sheet.

I think this may have slipped with Vin leaving in January.

See attached spreadsheet.

Currently, Lantel is doing Phase I of our city wide CIMS camera upgrade and they have not gotten these IP addresses which were requested back in November yet and it is extending the project timeline significantly.

I will be point from OEM for updates on this matter.

I appreciate the help.

Mike

All - I have added to this spreadsheet to include key information needed by Jerry and his team for providing the requested BONET IPs, such as:

- address and location details
- location contact
- planned cutover dates (for prioritization)
- confirmation on the # of IPs required

I am setting up a conference call for tomorrow (incite to follow) for all of us to discuss this further to ensure we are aligned. I will be inviting LanTel (Eric Johnson) to attend, also, for the cutover dates and other information he can provide.

Please let me know if you have any questions. Thanks.

Hi Linda,

I would like to add this item to our biweekly meeting hot sheet.

I think this may have slipped with Vin leaving in January.

See attached spreadsheet.

Currently, Lantel is doing Phase I of our city wide CIMS camera upgrade and they have not gotten these IP addresses which were requested back in November yet and it is extending the project timeline significantly.

I will be point from OEM for updates on this matter.

I appreciate the help.

Mike

Eric,
Regarding IPs for the BPD analog to digital replacement project, I have set up a conference call for all involved parties to discuss in detail. I included you on the invite so please plan to attend - tomorrow at 2pm.

I have added to the attached spreadsheet to include key information needed by Jerry and his team for providing the requested BONET IPs, such as:

- address and location details
- location contact
- planned cutover dates (for prioritization)
- confirmation on the # of IPs required

Please let me know if you have any questions. Thanks.

On Thu, Feb 25, 2016 at 4:06 PM, Jason MacDonald<jason.macdonald.bfd@cityofboston.gov> wrote:

Hello,

If you would Buy us the same setup for both Fire Headquarters and Fire Alarm that would be great.

The only change I would ask IF you could instead of 2 - 27" Monitors we could get 1 - 40 Inch Monitor for the FIRE ALARM setup only.

(Fire HQ would still get the 2-27 Inch)

We plan on displaying this system on multiple 40" inch monitors on the floor of the dispatch center.
If we could get multiple (6) 40 Inch monitors though this for this system that would be Ideal.

I am not sure if that is possible but figure the only way to find out is to ask.

This system will become an important part of the dispatch center and anything we can get from other resources will go a long way.

Thanks for your time and work and have a great day

All - we have updated this spreadsheet with additional information. It is complete with the required IP information.

- Added "Juniper interface" = our port #'s for reference

- Re-analyzed the connection point for the Mathers school and due to the BONET connection there, which is a 100MG shared public wireless link, we do NOT recommend using this link. Instead, we recommend using the secure BONET link at Engine 17.

Friendly reminder to provide the email of the contact to receive the monitoring alarms.
