Ian I have been reached out to by Andrew Murphy who works for Office of Emergency Management (OEM).

OEM is inquiring about the cost of purchasing 2 licenses for the Boston Fire Department. BFD wants access to all of the camera systems within the city of Boston.

Could you get a proposal together for the cost of these 2 licenses and respond to Andrew & Eric, both have been cc'd on this email.

Thank you
Vin Stancato

Attachment(s): "Quote21003.pdf"

Hi Shawn. I'm wondering if you absolutely need a Mac. They are significantly more expensive. Take a look at the attached quote from HiQ for a Lenovo machine I'm told is much more powerful than the Mac option. Plus we wouldn't need the Windows or VMware with the PC (Windows included in purchase) and wouldn't have a learning curve with the typical users of the machine at the EOC who are accustomed to a PC. If you give the ok I'll begin moving the money around to procure. Thanks.

Talk about timing. As you two were emailing back and forth on this issue, I was on the phone with Steve Lyons (FAC64 procurement manager) on a different matter and he gave me an update on the renewal process. He will be sending out the renewal documents this week, and confirmed that they are renewing existing contractors (as opposed opening up a whole new RFP process). He is getting an early start on the paperwork, but I believe the intent is that the renewal date will coincide with the expiration date of the existing contract.

This is very good news that they are renewing, rather than beginning a whole new RFP process.

Andrew, Joe Bodio is out of the office for the day and I need him to sign the forms. They should go out in tomorrow's mail. I will email you a copy as well as soon as they are ready.

Thanks!

Kate

Hi Andrew -- I will put the originals in the mail this morning. Can you verify where I should send them? It seems to always take weeks to get to you whenever I mail you something.

Thanks,

Kate

Hi Shawn. I'm wondering if you absolutely need a Mac. They are significantly more expensive. Take a look at the attached quote from HiQ for a Lenovo machine I'm told is much more powerful than the Mac option. Plus we wouldn't need the Windows or VMware with the PC (Windows included in purchase) and wouldn't have a learning curve with the typical users of the machine at the EOC who are accustomed to a PC. If you give the ok I'll begin moving the money around to procure. Thanks.

Subject: Mike Kane: Internet Explorer 11 Upgrade and Vidsys / DVTEL / Gentech

Hi Shawn and Linda,

With the upcoming browser upgrades to IE 11 citywide on 3/21/16 should we expect any issues with our current video application packages in place?

I was talking to my director and she said the last time we upgraded it caused degradation across the system.

Can we bring this up and get a clear answer on Wednesday.

Mike

Will this effect any of our CIMS systems?

----- Forwarded message -----

From: **Broadcast** <broadcast@cityofboston.gov>

Date: Tue, Mar 8, 2016 at 1:39 PM

Subject: Internet Explorer End Of Life Update:

To:

DoIT will be switching over to Internet Explorer 11 as of Monday 3/14/16 and the rest of the departments citywide IE older versions will also be upgraded to Internet Explorer 11 starting on Monday 3/21/16 if they have not already done so.

This is a requirement due to the fact that Microsoft has ended support for users of Internet Explorer 8, 9, and 10, which means that any older versions of IE is no longer receiving any security updates/patches or technical support, thus making anyone who uses the older versions of IE as a security risk.

We have found that IE11 in “enterprise mode” will continue to work for most applications. If you do have any issues you will need to update your software to a supported version.

DoIT thanks you for your attention to this important update.

Subject: Mike Kane: Chrome on DVTEL and VIDSYS Tuesday March 22nd

Hi Eric,

Can you stop by the EOC on Tuesday the 22nd so we can just make sure everything is running properly with the new Chrome browser.

Thanks so much,

Mike

Hi Shawn and Linda,

With the upcoming browser upgrades to IE 11 citywide on 3/21/16 should we expect any issues with our current video application packages in place?

I was talking to my director and she said the last time we upgraded it caused degradation across the system.

Can we bring this up and get a clear answer on Wednesday.

Mike

Mike,
Just to confirm it for you, I booted up a 6.3 CP1 system (with no LU) and am accessing it from an IE11 (with a PTZ) and everything is working great.

Are they on 6.3 or are they at CP1. I can't say 100% prior to CP1 since I don't have it in front of me. If it is prior to CP1, then I'll investigate with that version.

Do we have knowledge that 6.3 works w IE 11. This is for Boston PD. They are not at 6.4 yet...(they may jump to 7.0) but that's a few months out. The city is planning to cut over to IE 11 as a standard in next couple weeks and they want to avoid any issues with Web client access.

Subject: Indy Car work approval

Hi Eric. I wanted to let you know if anyone tasks LanTel with work associated with Indy Car preparations in Southie, OEM needs to approve. I also know BPD has other projects, like the moving and installation of equipment on Egleston Tower. Something like this likely would not fall under CIMS. It's possible LanTel isn't even involved. We just want to make sure CIMS funding is being spent appropriately. If you think BPD is tasking you with things outside the normal scope of your work let me know. Thanks Eric.

Thanks Andrew.

Shawn and Linda any thoughts on pros vs cons of setting this up prior to windows being installed or is there another avenue we can take to get that software loaded so we can get this up and running .

Subject: Security Camera Status Report for 3/30 Meeting

Attachment(s): "Security Camera Strategy Meeting_3-30-2016.docx"

Good morning,

Attached is the current status report for the Security Camera Strategy Meeting. Our next meeting is this Wed, 3/30, at 9:00am. Please plan to dial in for this meeting as I will be remote, for this week only.

Reminder: We are meeting weekly until the Marathon.

Thanks.

Linda Calnan

Sr. Project Manager | [Department of Innovation & Technology \(DoIT\)](#) | City of Boston

1 City Hall Square, Room 109

C: 781-738-2020

linda.calnan@boston.gov

Security Camera Strategy Status Meeting

Time: **Next meeting: Wednesday, 3/30/2016, 9:00AM – 10:00AM**
Location: Conference Room 115 / Dial In: 1-866-715-6967, Passcode: 4466461 (Host: 7860059)
Called by: Linda Calnan x2875

NOTE: For this week only: I will conduct this meeting remotely so please plan to dial in instead of attending in person.

I. Agenda-Locations / Meeting Notes / Action Items

Locations: (Updates in blue:)

- **Public Health - Jeff, Abhishek**
 - **203 River Street / EMS Storage Facility – BPHC to review and approve quote to purchase licenses. Per Jeff – will purchase appliance for River St. location at a later date when funding is allocated. Upgrading to 100MG metro Ethernet layer 2 connections. Per Brett – needs to issue DHCP (to avoid firewall reconfigs).** Juniper switch installed and VPN tunnel completed. Per Siemens, there are 15 concurrent licenses on the Genetec Core system. NOTE: the appliance is required equipment to keep cameras on line in the event of a Comcast line outage due to no redundancy. (Hampton St. does not need an appliance due to redundancy.) ~9 cameras.
 - **Strand Theater – Site survey conducted for placement of 12 cameras. Siemens provided quote. DoIT to package proposal for cameras with wifi proposal to present to Mayor's office for funding.**
 - **ISD/1010 Mass Ave. – Siemens to provide final quote. Note: wiring termination point must be to new/upgraded electrical outlets and/or closets.** The commissioner of property mgt would like to replace all the interior cameras along with what has already been surveyed. – Waiting on Leon Graves, legal, and Joe Callahan, for funding. Mike Flaherty managing.
- **City Hall New Camera Install – Camera replacements (33 cameras) completed. Project to be removed for next meeting.** Nelson analyzed the saturation of the archivers and think they are handling the load fine, storage was his main concern. We are following up on this. Per Dan ~ 70-80% saturation level is limit.
- **VidSys – Connecting State and City VidSys servers:**
 - **Interagency (BPD and MBTA) MOU – In progress – Shawn managing.**
 - **Interconnect COB & state/ MBTA systems and federate them together – Included in MOU and will begin when MOU is approved.**
- **MIT Lincoln Labs – Lincoln Labs and camera vendors are now collaborating to advance this.** DHS Sigma Program Presentation conducted 3/9.
- **85 Bragdon St. – BPD obtaining new MAC workstation with better graphic power. Ian changed the configuration of the active VidShield server (zvidsys02) to support 36 viewers per workstation.** BPD upgraded switch for 1GB handoff.

Security Camera Strategy

Status Meeting

- **Boston Housing Authority** – MOU done. Shawn and Vinny pushing this forward. (300 cameras, 34 facilities.)
- **Canterbury Street, Public Works (Comcast) (Warehouse for city lighting-theft & security issues)** – **Quote due this week ~16 cameras and local archiver.** This ties in with 1010 Mass Ave; waiting on electrical connectivity for cabling to the roof.
- **L Street/Curley Ctr** – Fiber lateral to be run; Procurement & Linda to initiate bid process once contract with Crown Castle is completed. When connectivity complete, cameras will connect in to our Genetec system. Two cameras have been set up on a temporary basis via Wifi.
- **Faneuil Hall – Ancient & Honorable – Mike** – **Completed 3/24. Trialing Access 180 degree camera. Will be removed for next week's meeting.**
- **Water & Sewer** – **Proposals provided and currently in review stage.** Cameras will connect to BONET; funding is all set (state agency); 67 cameras at Harrison and 37 cameras for Charlestown.
- **BFD – Headquarters and Fire alarm** – **Both locations are on BONET as core nodes. Network connectivity and access to DVTEL archiver end point to be set up by networking teams (Brett/Jim).** Licenses for 2 seats and training covered by DoIT and in payment process. BFD has ordered workstation for VidSys video viewing.
- **Downtown Crossing** – **Equipment ordered. Fiber handoff at Markley to BONET to be set up.** BTM has fiber on Washington St and Wilson to look for spare(s). Phase 1=17 new cameras, \$500K over 3 yrs; Shawn managing.
- **BPD HQ** – **Phase 2 to be reviewed with JPOC team on 4/4.** Phase 1 approved, Phase 2 in OEM. 2 projects: a.) cameras outside and down towards Ruggles; b.) cameras inside bldg.
- **Fiber Maps** – PSNet fiber for Boston and Brookline provided and being layered on to BONET fiber mapping. Fiber mapping data for UASI region fiber; school fiber; shadow conduits; Crown Castle fiber and GlobalNaps fiber.
- **Grand Prix Event** – **Lan-Tel = vendor.** BCEC area; will require temp video cameras set up on roofs (high location above netting). Shawn managing this project and working through federal and local issues.
- **Marathon** – Preparation meeting with cross-agencies (BAA, BTM, BCEC, MBTA, etc.) to be set up.
- **Body Cams** – **RFP for pilot/demo to be released.** Pilot = ~50 cams using 3-5 systems that can store ~ 12 hours of video locally to begin this year. BPD currently running this project independently. Requested to remain on report for status updates.

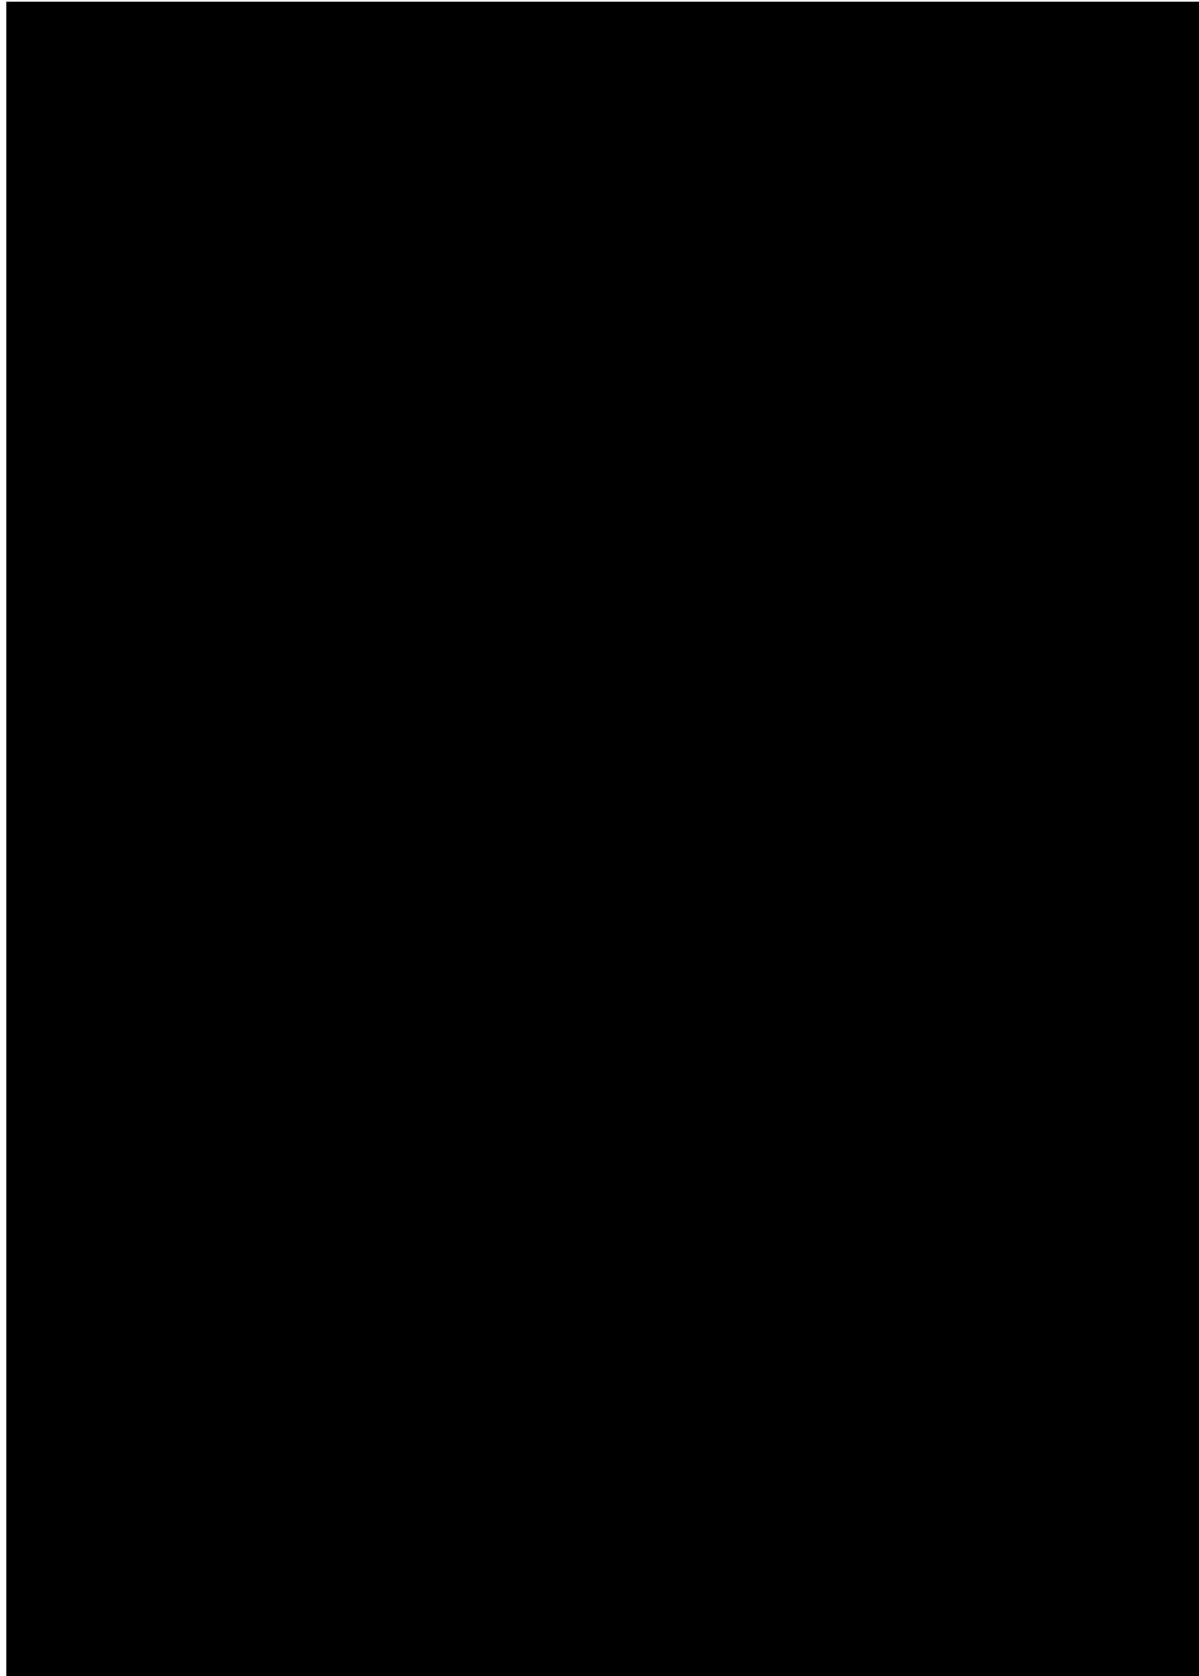

II. On weekly schedule until Marathon.

Thanks very much Vickie. Eric, I'm wondering if you could provide a quick justification on why this invoice is the largest we've received in a year. We were hoping with all the other jurisdictions recently having undergone hardware upgrades the monthly maintenance costs would go down. Maybe there was a perfect storm of issues in February, which certainly happens, I'm just hoping you can offer some detail. We may also need to find a way to keep costs down on a monthly basis without sacrificing service. Thanks again.

Andrew

Subject: Re: February 2016 CIMS Billing

Andrew :

The beginning of the month had some normal calls. We have had an issue with documented AT &T with interference issues at 300 Ocean Ave , Malden and Broadway and Seaview Towers. We have been working with AT &T on tweaking issues in a cost effective and operational way, but We had to ultimately move Malden and Broadway off the roof and relocate because this was the worst interference issue.

Winthrop wanted remote access to their Ipads. we worked them on connectivity through their network. So there was a small spike there for Winthrop. We had the same for Chief Kyes and Lt Griffin who wanted to see Chelsea cameras remotely on CIMS VPN since internal Chelsea corporate was too slow. We tried to accomodate both Chiefs and Admin staff.

We also have a higher amount of calls associated with Shotspotter . We and the towns are staying on top of gunshots / camera movement and the return to home position after an activation by gunfire. Since we cannot automatically monitor the shottspotter integration between SSD and CIMS we are trying to bridge that gap for integrity.

Everett City Hall had a major problem with conduit on roof. The original install had PVC pipe and that has degraded due to weather and people walking on the conduit and what not . This brought on with failures to the system and needless resets . we made a decision to change to metal conduit and just get it done since the resets were taking down many cameras in this area.

Walnut Park had old antenna and camera mounts that were dangerous and needed to be addressed. Some of these mounts were installed in 2004 and some of the camera installs were performed by other city workers. Please keep in mind this has no combination of your email this past week on this site. None of this work is related to BPD upgrade inside radio room. That has not been started as far as I know.
This was a safety issue.

We also had a network issue in Revere, for some reason we had interference issues on a link from Comfort Inn to 250 Broadway. We have also seen a small rise in network ports failing on the Cisco switches provided by PSNET. While we have been working with PSNET on links like I discussed now and previously , we have also been out resetting and physically changing ports for antennas and cameras, this was the case here, coupled with an interference issue. . We also changed the paths of the antenna to a more friendlier line of site from 250 Broadway to Hyman Towers. While we did troubleshoot this link for a bit , it seemed cost effective to move to this new line of site topology since we couldn't guarantee that the interference wouldn't happen again. We also were trying to minimize down time for Revere so this was a spike in labor. They were the same parts and equipment , just reconfigured.

From the 11th on we had a higher amount of calls from storm related issues. Which we repaired cameras and replaced some parts with no equipment cost to CIMS. In one instance we worked with BONET crew to fix a problem quickly after hours.

I believe this month we had a higher amount of problems with infrastructure and storm related issues. I believe we will see more of a software / network related issues on accessories of the CIMS camera system (Shotspotter / Ipads/ archived footage review) since we have more officers involved and being proactive with using the system than ever before. I would like to point out that we maintain a daily average of less than 10 cameras down over 400 system wide cameras. This equates to approximate 97% uptime for 8 towns over 24 hours.

As always ,we try to respond diligently and in a cost effect manner (Like last week with system wide power area outage caused by truck into pole) we monitored remotely and did not dispatch for the sake of dispatching. This happens many times and behind the scenes at 10,00 feet. If you look at spread sheet will see pockets of issues not system wide issues, and to further your point of upgrade negates calls of service , many of these areas were not new edge sites cameras or antennas failing , but upstream to network and infrastructure problems. In Boston proper you will see it was areas that have not been upgraded yet. I would like to involve you more with the bigger correspondence so to keep you in loop when the bigger brass are involved.

As always I can provide more information and or meet to discuss.

Thanks
Eric

Hi Louis,

Is this a new client machine? This is just the sequence of install requests that happen when a client without the required viewer drivers is first logged in to VidShield.

Looking at the viewers requested you must be using this client on the MBTA system, correct? The MBTA should have done the installs for all of the clients attached to their system on Friday night.

FYI. The upgrade for that system is not fully complete.

On Fri, Mar 25, 2016 at 3:26 PM, Thomas, Ian <ithomas@vidsys.com> wrote:

Hi Louis,

Thanks for the call earlier today. I would like to give you a quick training session on VidShield to get you going. It will not cover nearly enough of the product so I do still recommend that you attend the formal VidShield Administrator Training course in the near future.

How does 3/30 Wednesday morning at 10AM sound? I will be visiting the MBTA Wednesday afternoon so if it works for you I can visit you onsite. This would also be an opportune time to get the 7.7.1 executable distribution files downloaded to the zvidsys03 server.

Vidsys has undergone a recent management reorganization and there is a new executive point of contact to replace Paul Retzbach who you may have met previously. Neil Chung, the Vidsys VP for the Quality Management and Support Organization will be in town and this might be an opportunity for you and others at the City of Boston to meet with him. Let me know if this will work for you. And I will see if it will work with Neil's schedule for the week.

To: Louis Madeira
<louis.madeira@pd.boston.gov>

Hi Louis,

Is this a new client machine? This is just the sequence of install requests that happen when a client without the required viewer drivers is first logged in to VidShield.

Looking at the viewers requested you must be using this client on the MBTA system, correct? The MBTA should have done the installs for all of the clients attached to their system on Friday night.

FYI. The upgrade for that system is not fully complete.

On Fri, Mar 25, 2016 at 3:26 PM, Thomas, Ian <ithomas@vidsys.com> wrote:

Hi Louis,

Thanks for the call earlier today. I would like to give you a quick training session on VidShield to get you going. It will not cover nearly enough of the product so I do still recommend that you attend the formal VidShield Administrator Training course in the near future.

How does 3/30 Wednesday morning at 10AM sound? I will be visiting the MBTA Wednesday afternoon so if it works for you I can visit you onsite. This would also be an

opportune time to get the 7.7.1 executable distribution files downloaded to the zvidsys03 server.

Vidsys has undergone a recent management reorganization and there is a new executive point of contact to replace Paul Retzbach who you may have met previously. Neil Chung, the Vidsys VP for the Quality Management and Support Organization will be in town and this might be an opportunity for you and others at the City of Boston to meet with him. Let me know if this will work for you. And I will see if it will work with Neil's schedule for the week.

Subject: CIMS over PSnet

Hi Eric. I'm trying to get an understanding of how critical PSnet is to CIMS. Do any of the jurisdictions rely completely on PSnet to view their cameras? It's my understanding in order to view cameras from another jurisdiction PSnet would have to be involved. Do you have any knowledge of this? Thanks.

Subject: Re: CIMS over PSnet

Andrew sorry for late reply and this might be long to answer . In my opinion PSNET oversees the routers and switches that most of our hub sites plug into .

For instance Whidden Hospital . We run a lot of edge antennas to this site and connect into the same switch that is connected into the back hauls that path to Soldiers home and 25 Highland in Somerville etc. So in this instance the answer is yes on paper, butin my estimation it's only because they "maintain" the switch that I plug into. MY further opinion is that there is no special sauce to accomplish what they are doing .

Back in the day in 2007 we / I built this network out and maintained the original routers / switches and Backhauls and it was ALL called CIMS . It was then determined years later that Interisle have a demarcation of the Backhauls / routers / switches at these same hub sites (and we would be responsible from edge sites to hub) . The term PSNET slowly evolved regarding these Backhauls switches and routers and In some discussions Interisle then started calling the whole network PSNET .

Again in my opinion I don't see anything different in this network other than Chuck installing 20 year old switches and routers and embellishing the name of PSNET . It's same same topology , same paths , same Backhauls , just different switches and routers . If INTERISLE went out of business tomorrow Pretty much anyone could change to present day switches and routers , maintain the antenna Backhauls and things would hum along just like 2007 for video

.....Now what we don't know is what Chuck has configured for radio traffic on this network . The original concept for this network in 2007 was for video and "data" ...Never radio . You have to build a carrier class system with more bells and whistles to achieve reliability of not having packet loss etc. Video can adapt better to packet loss than voice.

I hope this helps , I could probably explain better verbally .

Respectfully ,

Eric Johnson

Subject: PSnet/CIMS: Update on JFK to Somerville PD link and Boston Ritz Carlton site

Attachment(s): "smime.p7s"

Eamon, Brenda, et al.,

This morning, Mark Savage from LAN-TEL was able to get to the JFK site and replaced the power supply that had failed for the DragonWave Horizon microwave link to Somerville PD. This important link is now back up, and Somerville has a second path into the PSnet backbone. Thank you, Mark. As an aside, it should be noted that most of Somerville's cameras are reached either via the Cambridge [former] Courthouse, or via the JFK site, both outside the jurisdiction of Somerville.

Later in the morning, Mark went to the CIMS installation on the roof of the Ritz Carlton in downtown Boston, and disconnected the microwave link that originally connected this site to the JFK building. He then connected the two cameras and the microwave links to other cameras into a PSnet switch that he had installed previously. This switch is in turn connected via a microwave link from the Ritz Carlton site to the MIT Eastgate residence hall just on the other side of the Longfellow Bridge. The MIT Eastgate site is connected via MIT and City of Cambridge fiber to the Level 3 and Courthouse sites that provide both fiber and microwave connections eventually getting to Boston's DVTEL servers at Schroeder Plaza.

I worked with Mark on this cutover, and changed the routing in the PSnet backbone so the Ritz Carlton cameras are now reached via the MIT Eastgate site, instead of the JFK building. The Ritz Carlton cameras and associated cameras at Downtown Crossing are now on a much faster, higher quality link that avoids most of the interference in the downtown area. We've leveraged resources that span jurisdictions and agencies to knit this together, but at very modest incremental cost. Today's accomplishments also reflect the teamwork and resource sharing that goes on constantly between the PSnet and CIMS teams, with the net result that we get much better resource utilization without duplication. We have also collaborated with the City of Cambridge and MIT to build out the underlying network facilities. The original "application" that established a PSnet presence at the MIT Eastgate facility was the deployment of public safety radios at this site that are tied back to the P25 Core at Schroeder. Now, we've been able to solve another problem of establishing a clean microwave link to the Ritz Carlton CIMS site in Boston so that these cameras can be reached reliably from Schroeder Plaza.

linda.calnan@boston.gov

Security Camera Strategy Status Meeting – 4/6/16

Time: **Wednesday, 4/6/2016, 9:00AM – 10:00AM**
Location: Conference Room 115 / Dial In: 1-866-715-6967, Passcode: 4466461 (Host: 7860059)
Called by: Linda Calnan x2875

I. Agenda-Locations / Meeting Notes / Action Items

Locations: (Updates in blue:)

- **Public Health - Jeff, Abhishek**
 - **203 River Street / EMS Storage Facility – BPHC has approved quote to purchase licenses.** Per Jeff – will purchase appliance for River St. location at a later date when funding is allocated. Upgrading to 100MG metro Ethernet layer 2 connections. Per Brett – needs to issue DHCP (to avoid firewall reconfigs). Juniper switch installed and VPN tunnel completed. Per Siemens, there are 15 concurrent licenses on the Genetec Core system. NOTE: the appliance is required equipment to keep cameras on line in the event of a Comcast line outage due to no redundancy. (Hampton St. does not need an appliance due to redundancy.) ~9 cameras.
 - **Strand Theater – Site survey conducted for placement of 12 cameras. Siemens provided quote. DoIT to package proposal for cameras with wifi proposal to present to Mayor's office for funding.**
 - **ISD/1010 Mass Ave. – Electrical work complete. Cabling to roof to begin in next couple of weeks.** Note: wiring termination point must be to new/upgraded electrical outlets and/or closets. The commissioner of property mgt would like to replace all the interior cameras along with what has already been surveyed. Mike Flaherty managing.
- **85 Bragdon St. – BPD obtained new MAC workstation with better graphic power. Ian changed the configuration of the active VidShield server (zvidsys02) to support 36 viewers per workstation. BPD upgraded switch for 1GB handoff.**
- **Boston Housing Authority – MOU complete. Shawn and Vinny pushing this forward. (300 cameras, 34 facilities.)**
- **Canterbury Street, Public Works (Comcast) (Warehouse for city lighting-theft & security issues) – Quote provided by Siemens; currently being reviewed by Fouad. 16 cameras and local archiver.** This ties in with 1010 Mass Ave - electrical complete; waiting on cabling to the roof.
- **L Street/Curley Ctr – No new update – waiting on contract completion.** Goal is to run fiber lateral to be run; Procurement & Linda to initiate bid process once contract with Crown Castle is completed. When connectivity complete, cameras will connect in to our Genetec system. Two cameras have been set up on a temporary basis via Wifi.
- **Faneuil Hall – Ancient & Honorable – Mike – Completed. Will remove next week.** (Trialing Access 180 degree camera at City Hall main lobby.)
- **Water & Sewer – Proposals provided and currently in review stage.** Cameras will connect to BONET; funding is all set (state agency); 67 cameras at Harrison and 37 cameras for Charlestown.

Security Camera Strategy

Status Meeting – 4/6/16

- **BFD – Headquarters and Fire alarm – Both locations are on BONET as core nodes. Network connectivity and access to DVTel archiver end point to be set up by networking teams (Brett/Jim).** Licenses for 2 seats and training covered by DoIT and in payment process. BFD has ordered workstation for VidSys video viewing.
- **Downtown Crossing –** Equipment ordered. Fiber handoff at Markley to BONET to be set up. BTM has fiber on Washington St and Wilson to look for spare(s). Phase 1=17 new cameras, \$500K over 3 yrs; Shawn managing.
- **BPD HQ – Phase 2 to be reviewed with JPOC team on 4/4. Shawn to provide update.** Phase 1 approved, Phase 2 in OEM. 2 projects: a.) cameras outside and down towards Ruggles; b.) cameras inside bldg.
- **VidSys – Connecting State and City VidSys servers:**
 - **Interagency (BPD and MBTA) MOU –** In progress – Shawn managing.
 - **Interconnect COB & state/ MBTA systems and federate them together –** Included in MOU and will begin when MOU is approved.
- **MIT Lincoln Labs –** Lincoln Labs and camera vendors are now collaborating to advance this. DHS Sigma Program Presentation conducted 3/9.
- **Fiber Maps – Continued work.** PSNet fiber for Boston and Brookline provided and being layered on to BONET fiber mapping. Next steps will be fiber mapping data for UASI region fiber; school fiber; shadow conduits; Crown Castle fiber and GlobalNaps fiber.
- **Grand Prix Event – Lan-Tel = vendor.** BCEC area; will require temp video cameras set up on roofs (high location above netting). Shawn managing this project and working through federal and local issues.
- **Marathon –** COB/DoIT looking to coordinate on-call support needs. Preparation across agencies (BAA, BTM, BCEC, MBTA, etc.) ongoing.
- **Body Cams – RFP for pilot/demo to be released.** Pilot = ~50 cams using 3-5 systems that can store ~12 hours of video locally to begin this year. BPD currently running this project independently. Requested to remain on report for status updates.

II. On weekly schedule until Marathon.

Subject: Re: Security Camera Status Update for Tomorrow's Meeting

Linda - I have a meeting with BPD and Capt Crossen so will need skip tomorrow.

I am still having the issues with MBTA workstation and the upload of VIDSYS.

Waiting on response back from Doit to get the logs off the workstation so LanTel can get the history.

Also waiting to hear on the Msft lic from the PO that OEM cut to Dell via Doit.

Many thanks,

Mike

Good afternoon all. Just checking in on the status of the EOC Vidsys Mac computer as we're fast approaching Marathon Monday. The computer is onsite at the EOC, we just need someone to set it up on the network, install VMware, install Windows, and any other Vidsys or DVtel software necessary. Our hope is this can be taken care of early next week in order to iron out any kinks. Please let me know ASAP if you foresee any issues. Thanks very much.

Dear Mike,

On behalf of Emergency Management, I would like to invite you to attend an upcoming webcast **Body Camera Projects: Going from Good to Great** taking place Wednesday, April 13th, from 11am-12pm PT. Join this discussion to learn what one city, Avondale, AZ has done to implement their officer-worn camera program.

During this webinar you will learn about:

- Policy decisions that are important to make
- Network infrastructure that will support your program
- Storage options – on-sight, cloud-based and long-term archives
- The role of data/video analytics

Featured speakers:

Rob Lloyd, CIO, City of Avondale
Mike Stetson, AE Field - SLED/Public Safety - Ohio Valley, Insight Public Sector

[You can register at no cost here.](#) Please feel free to share this information with any colleagues you feel would benefit from attending, and do let me know if you have any questions!

Thank you,

Dear Mike,

On behalf of Emergency Management, I would like to invite you to attend an upcoming webcast **Body Camera Projects: Going from Good to Great** taking place Wednesday, April 13th, from 11am-12pm PT. Join this discussion to learn what one city, Avondale, AZ has done to implement their officer-worn camera program.

During this webinar you will learn about:

- Policy decisions that are important to make
- Network infrastructure that will support your program
- Storage options – on-sight, cloud-based and long-term archives
- The role of data/video analytics

Featured speakers:

Rob Lloyd, CIO, City of Avondale
Mike Stetson, AE Field - SLED/Public Safety - Ohio Valley, Insight Public Sector

[You can register at no cost here.](#) Please feel free to share this information with any colleagues you feel would benefit from attending, and do let me know if you have any questions!

Thank you,

Harley Ebuenga
Registration Coordinator
Emergency Management

Subject: MK: 2016 Marathon Video Hot Wash and Request

Gentlemen,

Thanks so much for your help over the weekend. The videofeed was exponentially better than activations past and it looks like the investments paid off.

It was also great having both John and Louie on call to trouble shoot issues. They were both very helpful on Saturday's activities

LanTel was also extremely responsive and helpful on both days and it was appreciated.

Requests:

It would have been good to have a salvo for the Saturday Races out of the A1 cameras.

We request to load the proper software for the MSP Helicopter Downlink. I had two requests from BPD personnel for the downlink camera on Saturday and could not bring it up on either system.

We will need to work on the integration of both OEM video computers on the same network.

Thanks so much again.

Subject: CIMS - Global Camera System

Good Morning Deirdre,

I received your contact information from Eric Johnson. I am the new Director of Service here at LAN-TEL Communications. I am reaching out to our existing client base to speak to them about their current DVTEL video system. The Software Service Agreement (SSA) on your system for the CIMS Glocal system is not currently expired. This agreement grants you access to DVTEL software upgrades and updates as well as some other features for your system. It is a critical piece of system maintenance and I want to make sure there is no interruption to any of our client's systems. Please let me know if you are the correct person to speak to about renewing this agreement or if there is someone else I should be speaking to. I look forward to building a strong relationship with you and the Office of Emergency Management. Thank you for your attention to this subject.

Thank you,

Rich Ahern

Subject: Quote for Camera installation at BCYF Facility

Good morning Officer Madeira,

OEM is planning to utilize UASI physical security enhancement funding to support installation of cameras at the Tobin Community Center at 1483 Tremont Street in Mission Hill. BCYF had a vendor quote the install to them a few years back, but we are hoping to get an updated quote for installation of a DVtel system and to integrate the cameras onto the existing BPD camera network. I am cc-ing Deputy Commission Sulprizio from BCYF and Eric Johnson from Lan-tel Communications so that we can get an updated quote and coordinate installation and incorporation into the CIMS network.

Thank you,

Hello,

Eric Johnson from Lan-tel Communications and I will be stopping by the Tobin Community Center tomorrow at about 2pm. Eric will be conducting the requested survey of that location. If you could forward me the name of a contact person at the community center, it would go a long way to help facilitate the survey process. Please contact me with any questions or concerns.

Respectfully,

On Tue, May 3, 2016 at 11:32 AM, Deirdre Habershaw<deirdre.habershaw@boston.gov> wrote:

Good morning Officer Madeira,

OEM is planning to utilize UASI physical security enhancement funding to support installation of cameras at the Tobin Community Center at 1483 Tremont Street in Mission Hill. BCYF had a vendor quote the install to them a few years back, but we are hoping to get an updated quote for installation of a DVtel system and to integrate the cameras onto the existing BPD camera network. I am cc-ing Deputy Commission Sulprizio from BCYF and Eric Johnson from Lan-tel Communications so that we can get an updated quote and coordinate installation and incorporation into the CIMS network.

Thank you,

Subject: Assembly Sq target hardening Cameras

Good late afternoon,

I am trying to locate the award letter and go that Andrew sent me relative to the 5 PTZ cameras at Assembly Row that was allocated with 15 funding. I can't seem to locate it in my email. Any help by anyone would be great. Not sure if it was for 35 or 42 K

Much appreciated,

Mike

Security Camera Strategy Status Meeting – 5/11/16

Time: **Wednesday, 5/11/2016, 9:00AM – 10:00AM**

Location: Conference Room 115 / Dial In: 1-866-715-6967, Passcode: 4466461 (Host: 7860059)

Called by: Linda Calnan x2875

I. Agenda-Locations / 4/27 Meeting Notes / Action Items

Locations: (Updates in bold:)

Public Health - Jeff, Abhishek

- **203 River Street / EMS Storage Facility – Camera installations complete and connected to the video network. Will remove next week.** Per Jeff – will purchase appliance for River St. location at a later date when funding is allocated. (The appliance is required equipment to keep cameras on line in the event of a Comcast line outage due to no redundancy.)
- **Strand Theater – DoIT team met and have begun drafting proposal** package for cameras with wifi proposal to present to Mayor's office for funding. Goal = complete package draft by mid-May.
- **ISD/1010 Mass Ave. – Bid for cameras and inside cabling published.** Site analysis determined 3 external cameras require extended cabling which have been added to the quote & bid. Cabling to roof to completed.

- **85 Bragdon St. – Next project = July 4th preparation.**
- **Boston Housing Authority – Working on fiber run for connectivity to BONET.** Working with Sully Mac and Comcast to move this forward and obtain commitments. Will produce timeline when possible. MOU complete. (300 cameras, 34 facilities.)
- **City Hall Genetec Upgrade – Upgrade to be completed = 5/10.** Mike managing this project.
- **Canterbury Street, Public Works (Comcast) (Warehouse for city lighting-theft & security issues) – Comcast line upgrade to 100MG pricing + router purchase presented to J. Crossen – waiting on their final approval.** Quote provided by Siemens; currently being reviewed. 16 cameras and local archiver.
- **L Street/Curley Ctr – No new update.** Waiting on finalized agreement with Crown Castle. Goal is to run fiber lateral from BONET to Curley Ctr. Bid process is required per legal and will begin once the agreement with Crown Castle is completed. When connectivity complete, cameras will connect in to our Genetec system. Two cameras have been set up on a temporary basis via Wifi.
- **Water & Sewer – Joe Crossen working with Siemens on camera details and quote.** (Henry Vitali = Exec Dir.) Siemens provided quote to replace existing cameras and video system to Genetec. Does not connect to BONET. Funding is all set by water & sewer (state agency); 67 cameras at Harrison and 37 cameras for Charlestown. Joe (and Linda) managing this project.

Security Camera Strategy Status Meeting – 5/11/16

- **BFD – Headquarters and Fire alarm – Waiting on 2nd workstation which is due in this week and will be completed next week-5/13.** Commissioner's workstation installation and video access completed. Both locations are on BONET as core nodes. High-end workstations set up for BFD HQ (Done) & Alarm (by 5/13) for video viewing. Will follow schedule, below, for 2nd workstation.

High Level Schedule	Date	Resource
2 nd Workstations Received for Fire Alarm	~5/13	Jason (BFD)
Workstation Installations Completed	Target~5/19	Louis (BPD)
Video Software Loaded	Target~5/19	Ian (VidSys)
Network Connectivity Completed	Target~5/19	Ken (BFD) Brett (COB)
Test/Confirm Video Viewing Meets Requirements of BFD	Target~5/19	Jason (BFD) Louis (BPD)

- **Downtown Crossing – Almost complete – working on iPad integration.** Camera installs (17) completed. Network connectivity to BONET all set. Phase 1=17 new cameras, \$500K over 3 yrs; Shawn managing.
- **BPD HQ – Both Phase 1 & 2 have been approved.** 2 projects: phase 1) cameras outside and down towards Ruggles; phase 2) cameras inside bldg.
- **VidSys – Connecting State and City VidSys servers: No new update**
 - **Interagency (BPD and MBTA) MOU** – In progress – Shawn managing.
 - **Interconnect COB & state/ MBTA systems and federate them together** – Included in MOU and will begin when MOU is approved.
- **MIT Lincoln Labs – No new update – ongoing collaboration.** DVTel (and other vendor engineers) making progress with Lincoln Labs engineers on simplifying the software. Lincoln Labs and camera vendors are now collaborating to advance this. DHS Sigma Program Presentation conducted 3/9.
- **Fiber Maps – Linda working to obtain Loop A fiber map.** Continued work. Met with Quincy PD/FD and expect to receive fiber maps. PSNet fiber for Boston and Brookline provided and being layered on to BONET fiber mapping. Next steps will be fiber mapping data for UASI region fiber; school fiber; shadow conduits; Crown Castle fiber and GlobalNaps fiber.
- **Body Cams – Bid closed. Expecting to trial cameras this summer.** Legal requiring the equipment be purchased thru a GSA vendor. Shawn managing. Pilot = ~50 cams using 3-5 systems that can store ~ 12 hours of video locally to begin this year. BPD currently running this project independently. Requested to remain on report for status updates.

II. On bi-weekly schedule. Will meet weekly when in preparation mode for July 4th.

Hi Eric,

Yes. Thank you very much. The proposal to fund this will be on the next JPOC meeting scheduled for June 9th. Then I'll be able to take some formal steps. Thank you for pulling this together. FYI, I mentioned this proposal to Linda Calnan in DoIT as we want to make sure that however the software is accessed and camera controls configured is inline with how DoIT and BPD want access configured.

Thank you for your assistance, as always.

Deirdre

Subject: PSnet: Problems with JFK<=>Broadway Twr DragonWave AirPair microwave link
Attachment(s): "smime.p7s"

Steven, et al.,

At around 04:50 this morning, the DragonWave AirPair microwave link between JFK and Broadway Tower went down. Between 05:00 and 09:00, it came back for a few minutes each time, and then went down solidly until 13:30, when it started bouncing up and down every few minutes. This behavior has continue up until now. Because of the fiber link to the Reservoir site, and the other microwave link to Soldiers' Home, the Broadway Tower site has remained reachable throughout the day.

However, the problem with a link that bounces like this is that it creates a lot of re-routing events, which can be disruptive to other traffic. These are momentary glitches, that affect different applications in various ways. In order to avoid frequent re-routing events, I have increased the OSPF metrics so that this link to JFK will only be used when all other paths are unavailable.

Although I have tried multiple ways to clear up this problem, nothing has seemed to make any lasting improvement. When the link is up, the signal levels are quite good. My best guess at the moment is that there is some problem with the JFK end of this link. Because we replaced the Broadway Tower outdoor modem and encoder this past year, it is less likely that the problem is with this end.

For the time being, everything is now stable. Furthermore, the Winthrop PD to JFK link is currently working fine, so traffic from Boston has a good path to Winthrop/Revere, plus there are other paths available as well.

Steven, et al.,

Well, shortly after sending this memo, the DragonWave link from Broadway Tower to JFK started working again without the bouncing up and down. I'd love to claim credit for fixing this, and maybe my last reset attempt actually did do some good, but I'm afraid this is just a flaky situation.

Given the current circumstances, I'm going to leave the route metrics set high on this link, so that traffic will only go via this link when no other paths are available.

Let's hope this thing has gotten over its 24-hour bug, and stays healthy going forward.

Between 05:00 and 09:00, it came back for a few minutes each time, and then went down solidly until 13:30, when it started bouncing up and down every few minutes. This behavior has continue up until now. Because of the fiber link to the Reservoir site, and the other microwave link to Soldiers' Home, the Broadway Tower site has remained reachable throughout the day.

However, the problem with a link that bounces like this is that it creates a lot of re-routing events, which can be disruptive to other traffic. These are momentary glitches, that affect different applications in various ways. In order to avoid frequent re-routing events, I have increased the OSPF metrics so that this link to JFK will only be used when all other paths are unavailable.

Although I have tried multiple ways to clear up this problem, nothing has seemed to make any lasting improvement. When the link is up, the signal levels are quite good. My best guess at the moment is that there is some problem with the JFK end of this link. Because we replaced the Broadway Tower outdoor modem and encoder this past year, it is less likely that the problem is with this end.

For the time being, everything is now stable. Furthermore, the Winthrop PD to JFK link is currently working fine, so traffic from Boston has a good path to Winthrop/Revere, plus there are other paths available as well.

Steven, et al.,

Well, shortly after sending this memo, the DragonWave link from Broadway Tower to JFK started working again without the bouncing up and down. I'd love to claim credit for fixing this, and maybe my last reset attempt actually did do some good, but I'm afraid this is just a flaky situation.

Given the current circumstances, I'm going to leave the route metrics set high on this link, so that traffic will only go via this link when no other paths are available.

Let's hope this thing has gotten over its 24-hour bug, and stays healthy going forward.

Good Morning !

To all Invitees and featured customers :

Lan - Tel Communications has moved to a new spacious and cutting edge office in Norwood MA.

I am sincerely extending this invitation to all that I personally interact with, so you can intimately see our vision for tomorrow , and partake in our exciting new venture and celebration.

This expansion will introduce and make available new resources to meet the 24/7 demand of your respected departments , agencies and environments . I hope that you can stop by , have a cup of coffee and share in our excitement . I know your schedules are very tight , I hope to see you there and personally introduce you to the extended Lan-Tel family .

Thank you for your continued business and support !

Please RSVP to me if you would like to attend .

Respectfully ,

Eric Johnson

Kate,

Thank you for touching base with me earlier regarding a subcontract for Interisle to manage PsNet for the short term. We appreciate Lan-Tel's willingness to help the region during this time.

I have Cc'd Chuck Wade, Interisle Consulting Group, so the two of you can connect to complete the subcontracting documentation process. For the record, the services requested from Interisle will be to provide consultant services for the network and technical management for the PSnet network infrastructure in the Metro Boston Homeland Security Region.

Thanks again and let me know if I can help with anything.

Hi Gents,

Wanted to see if you had developed any salvos for this years July 4th events.

Could you send Sgt Cunniffe and I the names of the salvos when completed.

Thanks so much,

Mike

Security Camera Strategy Status Meeting – 6/22/16

Time: **Wednesday, 6/22/2016, 9:00AM – 10:00AM**

Location: Conference Room 115 / Dial In: 1-866-715-6967, Passcode: 4466461 (Host: 7860059)

Called by: Linda Calnan x2875

I. Agenda-Locations / Status Updates / Action Items

Locations: (Updates in bold:)

- **Public Health – Various ongoing projects:**
 - **BPHC/EMS** - Enable 45 user logins with appropriate access and coordinate Genetec training. Jeff/Linda managing.
 - **Strand Theater** – DoIT team continues drafting proposal package for cameras with wifi proposal to present to Mayor's office for funding. Will focus on this once PeopleSoft RFP is mostly complete ~ early July.
 - **BPHC-112 S. Hampton** – new cameras needed to replace existing. Siemens to assess
 - **1010 Mass Ave/Cameras** – Roof camera repositioned to bldg. front. Cabling for cameras complete. Siemens reassessed camera positions. Dates being coordinated for next steps:
 - a.) order & install Ethernet extenders
 - b.) order & install cameras
 - c.) complete terminations and test cameras
- **85 Bragdon St.** – Next project = July 4th preparation. BPD Mass State Police uplink – Mike Kane managing.
- **Boston Housing Authority – Working with BPD on obtaining the following info – Linda setting up team meeting to design (J.Surette/Shawn/Linda)** (300 cameras, 34 facilities):
 - BHA locations involved
 - # and location of cameras at the involved sites
 - Network connectivity strategy – IPsec tunnels, per Brett
- **City Hall – BTD and DoIT coordinating Genetec upgrade to 5.4 over next few weeks – Nelson/Wilson to coordinate timeline.** BTD - Joe Smith/tow lot view only access to be completed by next week.
- **Mayor's Office** - BPD networking to add new workstation (Winnie's swapout) to finalize this project. Nelson to enable iOS in Genetec for iPad devices to view cameras for designated Mayor's office personnel.
- **St. Mary's Hub, Dorchester – Relocation of BPD camera network hub to BFD Engine 21 – IPs provided by BONET team; relocation in progress.**
- **Mattapan EMS Station** – User account set up on workstation for John Cushing to see cameras at River St. – in progress.
- **Canterbury Street, Public Works (Comcast) (Warehouse for city lighting-theft & security issues)** –Waiting on Public Works final approval of quote provided by Siemens for 16 cameras and local archiver. Fouod is lead for this project.

Security Camera Strategy

Status Meeting – 6/22/16

- **L Street/Curley Ctr** – Still waiting on contract or approval to move forward. Wifi cameras have been unreliable lately and have required manual adjusting. **Jascha – anything you can do to move this project forward would be great.**
- **Water & Sewer – HQ-Harrison Ave (78 cameras) & Alford St (37 cameras) - Joe Crossen working with Siemens on this.** (Henry Vitali = Exec Dir.) RFP for engineering svc's to assess video surveillance and door access systems. Then will hold public bid for upgrade/replacement work. Timeframe ~ June for engineering RFP responses.
- **BFD – Headquarters and Fire alarm – Waiting on 2nd workstation-Mike Kane working to resolve this issue.**
- **Downtown Crossing – 3 cameras left to install and integrate. Continued work on iPad integration.** Shawn managing.
- **BPD HQ – Need update from BPD.** Approved project: phase 1) cameras outside and down towards Ruggles: phase 2) cameras inside bldg. VidSys contract needs approval and PO. Jerry recommends to run extra CAT5 cable on roof for 2 cameras and wifi.
- **VidSys – Connecting State and City VidSys servers:**
 - Interagency (BPD and MBTA) MOU – **Completed**
 - Interconnect COB & state/ MBTA systems and federate them together – Included in MOU and will begin when MOU is approved.
- **BCYF – 112 Paris St. Fiber & Cameras – BCYF currently under construction so camera project to begin ~ 8 months.** Plan is to install pt-to-pt wireless connection and add 2 addt'l cameras to suite for a total of 15 cameras. Network connectivity also required for ~45 workstations. No VoIP requirements initially – plan is to use analog until fiber is installed. Linda/Jerry working with Ken Griffin (COB PM) and BCYF team on this.
- **Fiber Maps** – Fiber mapping continued - data for UASI region fiber; school fiber; shadow conduits; Crown Castle fiber and GlobalNaps fiber.
- **Body Cams – Need update from BPD.** Bid closed. Expecting to trial cameras this summer. Shawn managing. Pilot = ~50 cams using 3-5 systems that can store ~ 12 hours of video locally to begin this year. Storage considerations to infrastructure need to be reviewed regarding potential bandwidth hit when uploading video. BPD currently running this project independently. Requested to remain on report for status updates.

Security Camera Strategy Status Meeting – 6/22/16

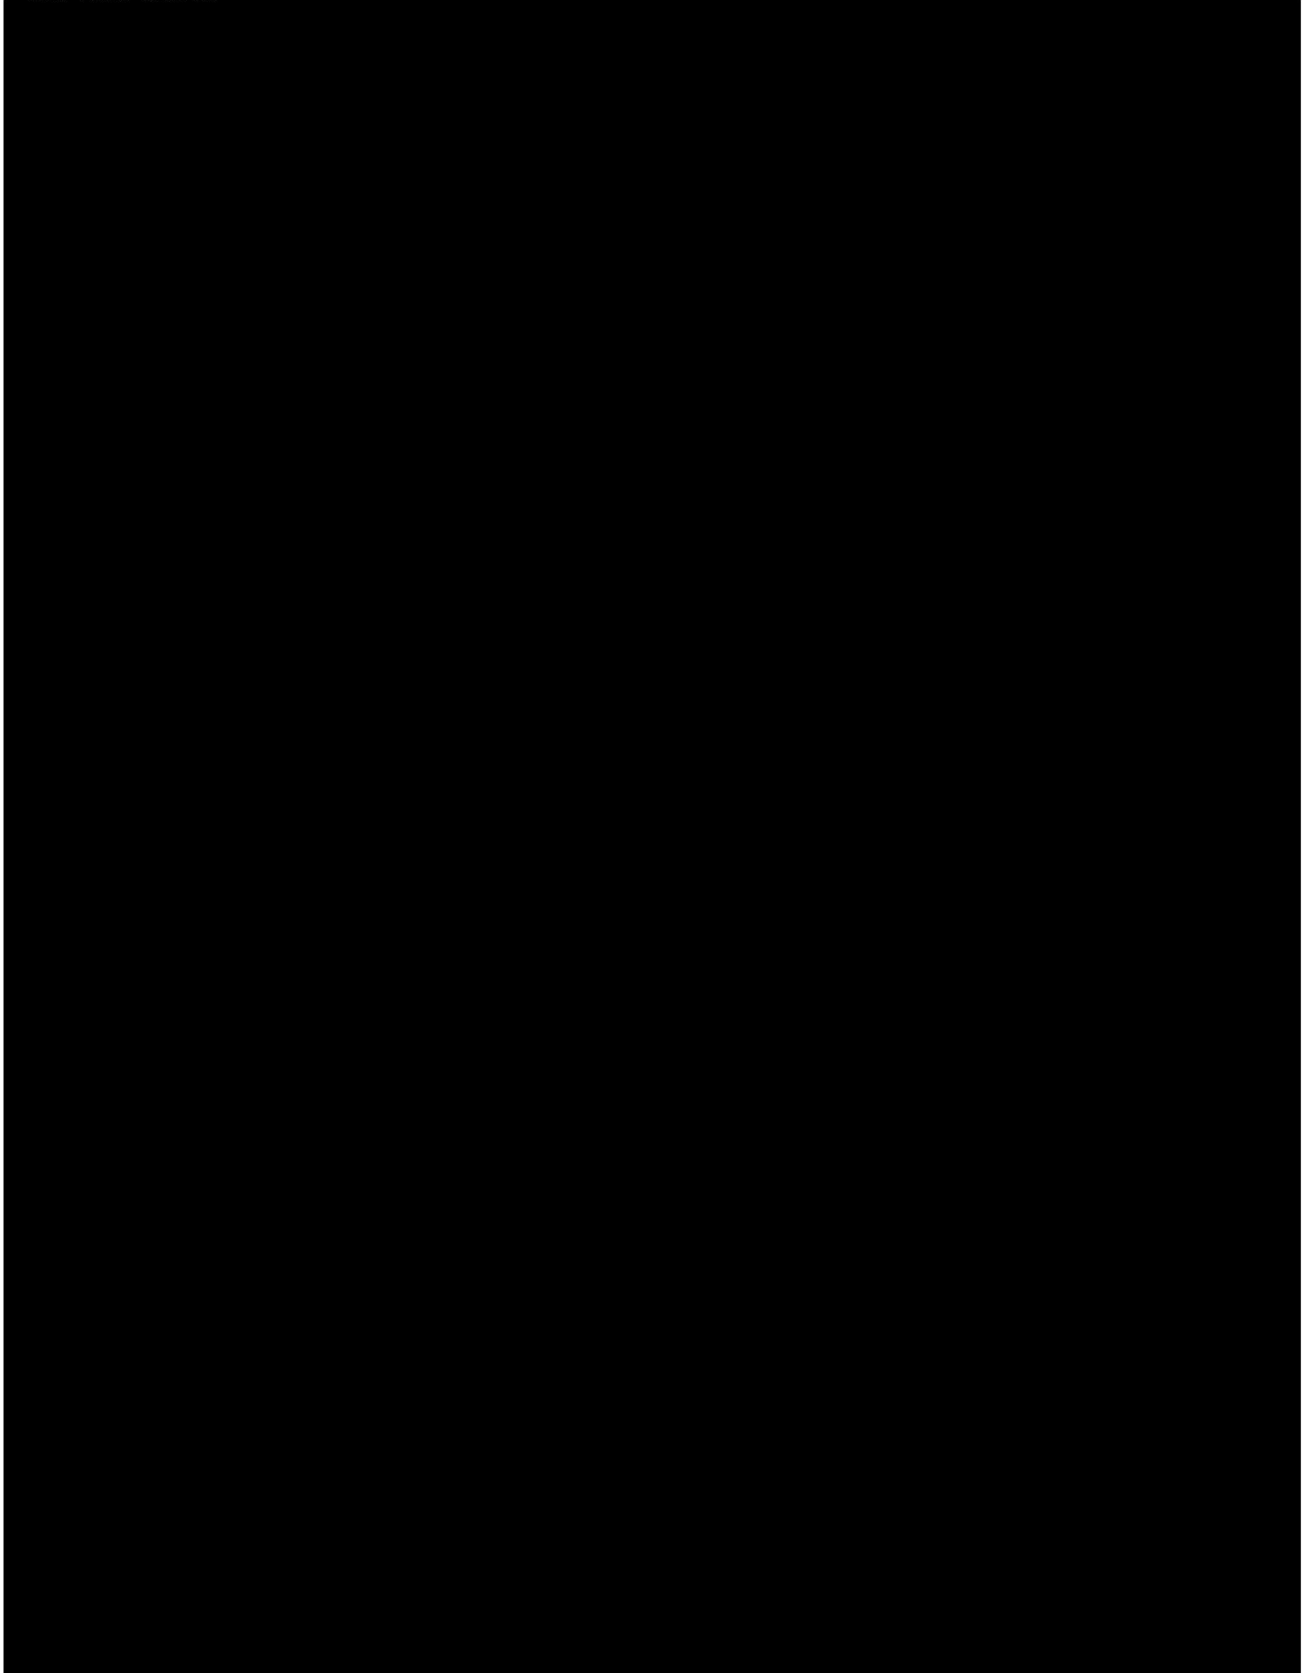

II. On bi-weekly schedule.

Subject: PSnet-Admin: Invoice for InterMapper annual maintenance renewal
Attachment(s): "V0000013139 - City of Boston .pdf", "smime.p7s"

Eamon,

I am forwarding the latest invoice received from HelpSystems for renewing the annual maintenance for InterMapper servers and remote access clients. PSnet and CIMS rely on this maintenance contract for support and upgrades throughout the year. Upgrades add features, but also correct bugs we report, and include necessary security fixes.

The invoice includes three server licenses for unlimited devices. This is a grandfathered license that we do not want to lose, as it is quite cost effective, given the enormous number of devices that PSnet and CIMS monitor. In addition, the pooled set of 10 remote access licenses are also grandfathered. To be clear, it is no longer possible to order new licenses for unlimited devices or pooled remote access clients.

In the past, Interisle has paid these invoices directly to HelpSystems, and then invoiced OEM to recover our expense (with no markup). However, given the current situation, we are not in a position to handle this invoice, at least not without specific guidance.

If this could be paid directly by OEM, that would probably be the best option. We can arrange for HelpSystems to invoice OEM directly; just let us know how the invoice should be addressed. The total amount of this invoice comes to \$3,442.00. This is a reasonable annual cost given the extensive use we make of InterMapper and its ability to allow anyone within MBHSR to use InterMapper, or leverage InterMapper services.

Here is a breakout of the invoice in a way that should be easier to follow:

Item	Description	Qty	Unit Price	Ext. Price
1	InterMapper server license for unlimited devices (grandfathered license; 3 servers required for unlimited devices)	3	\$839.00	\$2,517.00
2	InterMapper Remote Access clients 10-pack (pooled) (grandfathered; pooled licenses can be shared by an unlimited # of users)	1	\$389.00	\$389.00
3	InterMapper Remote Access clients 10-pack (standard) (these are for individual users; typically heavy users)	1	\$536.00	\$536.00
Invoice Total:				\$3,442.00

Let us know if you have any questions, and how you would like to proceed.

...Chuck

Subject: PSnet: Fiber link between 1 Summer & 300 Bent NoX suites has been restored
Attachment(s): "smime.p7s"

Folks,

The fiber link between Boston and Cambridge has been restored as of 13:36 this afternoon. I confirmed with the Cambridge E911 shift supervisor that the cutover did **not** disrupt the Motorola consoles this time (see below for a possible explanation as to why this was not disruptive today when this link was restored). The key point is that we now have both the fiber and microwave paths to the P25 Core at Schroeder available again.

A tip 'o the hat to Brian Mollo, who was able to switch the PSnet connection over to another pair of working fibers between the PSnet switches in the NoX suites at 300 Bent and 1 Summer. We had lost this link on June 29 at 00:06 EDT (just after midnight). The reason for the outage was that the Longfellow construction required another move of fibers to a different conduit bank, and this required re-splicing all strands. For some reason the pair of strands we were using did not get spliced correctly. The rest of this memo provides some additional details on further changes made today for anyone interested.

Since we had the fiber link between Boston and Cambridge down due to this fiber outage, I took advantage of the situation to re-work configurations for the PSnet switches at the 300 Bent and 1 Summer NoX suites. In the process of working on these switches, I discovered additional missing route configurations, which I was able to correct. This may be why there was no disruption of the Motorola consoles when we restored the cross-river fiber, which resulted in traffic being rerouted over this link. In particular, we now have OSPF routing re-established between the PSnet switch at 1 Summer, and the switch at Boston City Hall. This, in turn, improves routing for the connections to MBTA, and provides another path to 35 Northampton via the microwave link to Transit Police HQ. For the curious, the likely explanation as to why routing over the fiber between 1 Summer and City Hall was lost was that Galaxy used to use this fiber for another Internet path for the City of Boston (and EOPSS) to 1 Summer and to the MXP in City Hall. When Galaxy shut down in June 2013, they let some interfaces revert to default settings, which were not correct. The problem with default settings is that they are not visible when reviewing listings, hence my tendency to avoid using defaults for critical functions, such as routing. I was also able to correct another problem with OSPF route updates being exchanged between 300 Bent and Cambridge Fire.

Another important change I was able to implement is that we now have a full Layer 2/3 connection between the PSnet switches at 300 Bent and Cambridge Fire. This connection actually goes via a pair of BBN switches that provide a 10 Gbps link between these two sites, and this link is shared with BBN and Harvard (PSnet has a full 1 Gbps slice of this bandwidth). Technically, we are running over a VLAN Tunnel, which is why we're able to establish a "trunked" interface between the PSnet switches, which means we can now multiplex multiple VLANs over this path. In the process of setting this up, we found another interface inconsistency for the connection at 300 Bent, which Brian and I were able to resolve.

Finally, I also rebooted both the 300 Bent and 1 Summer switches to change memory allocation for the ASIC chips at the core of these switches (so we can use extended matching). At the 300 Bent switch, I have also bumped up the MTU size, but I'm holding off on doing this at 1 Summer, since BoNet does not support carrier-class MTU sizes. One consequence of performing the reboot at 300 Bent is that we lost our record holder for the longest, continuously operating switch in PSnet. Until the reboot, the 300 Bent switch was reporting its uptime as 6 years and 6 weeks!!! Here is a display of this information captured just before the reboot:

```
PSnet300BentSt#show clock
10:54:54.955 EDT Fri Jul 1 2016
PSnet300BentSt#show version | include uptime
PSnet300BentSt uptime is 6 years, 6 weeks, 2 days, 19 hours, 10 minutes
```

That's an impressive record, and of course this switch is continuing to work reliably, but its uptime counter was restarted. Overall, the reliability of the Cisco 3550-12 switches has been outstanding.

Hope everyone has a great 4th of July...

...Chuck

This, in turn, improves routing for the connections to MBTA, and provides another path to 35 Northampton via the microwave link to Transit Police HQ. For the curious, the likely explanation as to why routing over the fiber between 1 Summer and City Hall was lost was that Galaxy used to use this fiber for another Internet path for the City of Boston (and EOPSS) to 1 Summer and to the MXP in City Hall. When Galaxy shut down in June 2013, they let some interfaces revert to default settings, which were not correct. The problem with default settings is that they are not visible when reviewing listings, hence my tendency to avoid using defaults for critical functions, such as routing. I was also able to correct another problem with OSPF route updates being exchanged between 300 Bent and Cambridge Fire.

Another important change I was able to implement is that we now have a full Layer 2/3 connection between the PSnet switches at 300 Bent and Cambridge Fire. This connection actually goes via a pair of BBN switches that provide a 10 Gbps link between these two sites, and this link is shared with BBN and Harvard (PSnet has a full 1 Gbps slice of this bandwidth). Technically, we are running over a VLAN Tunnel, which is why we're able to establish a "trunked" interface between the PSnet switches, which means we can now multiplex multiple VLANs over this path. In the process of setting this up, we found another interface inconsistency for the connection at 300 Bent, which Brian and I were able to resolve.

Finally, I also rebooted both the 300 Bent and 1 Summer switches to change memory allocation for the ASIC chips at the core of these switches (so we can use extended matching). At the 300 Bent switch, I have also bumped up the MTU size, but I'm holding off on doing this at 1 Summer, since BoNet does not support carrier-class MTU sizes. One consequence of performing the reboot at 300 Bent is that we lost our record holder for the longest, continuously operating switch in PSnet. Until the reboot, the 300 Bent switch was reporting its uptime as 6 years and 6 weeks!!! Here is a display of this information captured just before the reboot:

```
PSnet300BentSt#show clock
10:54:54.955 EDT Fri Jul 1 2016
PSnet300BentSt#show version | include uptime
PSnet300BentSt uptime is 6 years, 6 weeks, 2 days, 19 hours, 10 minutes
```

That's an impressive record, and of course this switch is continuing to work reliably, but its uptime counter was restarted. Overall, the reliability of the Cisco 3550-12 switches has been outstanding.

Hope everyone has a great 4th of July...

...Chuck

On Jul 1, 2016, at 3:17 PM, Chuck Wade <Chuck@Interisle.net> wrote:

Folks,

The fiber link between Boston and Cambridge has been restored as of 13:36 this afternoon. I confirmed with the Cambridge E911 shift supervisor that the cutover did *not* disrupt the Motorola consoles this time (see below for a possible explanation as to why this was not disruptive today when this link was restored). The key point is that we now have both the fiber and microwave paths to the P25 Core at Schroeder available again.

A tip 'o the hat to Brian Mollo, who was able to switch the PSnet connection over to another pair of working fibers between the PSnet switches in the NoX suites at 300 Bent and 1 Summer. We had lost this link on June 29 at 00:06 EDT (just after midnight). The reason for the outage was that the Longfellow construction required another move of fibers to a different conduit bank, and this required re-splicing all strands. For some reason the pair of strands we were using did not get spliced correctly. The rest of this memo provides some additional details on further changes made today for anyone interested.

Since we had the fiber link between Boston and Cambridge down due to this fiber outage, I took advantage of the situation to re-work configurations for the PSnet switches at the 300 Bent and 1 Summer NoX suites. In the process of working on these switches, I discovered additional missing route configurations, which I was able to correct. This may be why there was no disruption of the Motorola consoles when we restored the cross-river fiber, which resulted in traffic being rerouted over this link. In particular, we now have OSPF routing re-established between the PSnet switch at 1 Summer, and the switch at Boston City Hall. This, in turn, improves routing for the connections to MBTA, and provides another path to 35 Northampton via the microwave link to Transit Police HQ. For the curious, the likely explanation as to why routing over the fiber between 1 Summer and City Hall was lost was that Galaxy used to use this fiber for another Internet path for the City of Boston (and EOPSS) to 1 Summer and to the MXP in City Hall. Subject: Re: Brookline- disconnected from core

Attachment(s): "smime.p7s"

Scott,

Fred looked at this situation last evening, and I've just looked through our charts and DragonWave logs. It does appear that the DragonWave Horizon at Egleston (Walnut Park) started behaving poorly at about 20:40:30 last evening, and dropped out completely when the rain became heavy at around 21:25:15. It stayed down until 22:30:15, but then came up only sporadically with multiple up/down events until almost exactly 02:00:00 early this morning. In reviewing the data I captured using DragonWave's "Merlin" diagnostic tool, it seems that this particular radio has multiple problems. While it might appear this problem was triggered by last evening's rain showers, this appears to be more coincidence than actual cause. Historically, this is not the first time we've seen this radio behave in a flaky manner, and we've had almost identical problems with the very similar model at Somerville PD that shoots to JFK.

As an aside, the DragonWave Horizon 400 radio link from East Boston HS to the Commonwealth's MITC facility at 200 Arlington in Chelsea (i.e., the EOPSS CJIS data center) mysteriously decided to start working again on June 28, after being out of commission for over six months. This is unfortunately a pattern of behavior we've observed with both the DragonWave and BridgeWave radios where they will work reliably for a prolonged period, then go flaky on us for a period of time, and then suddenly start working again as though nothing ever happened.

The reason Brookline had so many problems with your Motorola consoles last evening into the early hours of today was that the link to Egleston was bouncing up and down. This in turn caused multiple routing events, which are the very thing that causes problems for these consoles. I will watch this situation today, but I'm likely to increase routing metrics from Brookline via Egleston so that the only time this link will ever get used is when the Mimosa link to MIT goes down, which fortunately has not been a problem. For instance, despite the briefly intense rain showers last evening, the Mimosa link was unaffected due to the natural rain fade immunity of 5GHz radios.

What we need is a more permanent solution to the connectivity problems affecting Brookline. Assuming we proceed with the plan to address the Egleston tower rework and restore the connection to Schroeder Plaza via NE Baptist Hospital, then we can also get the DragonWave Horizon radio at Egleston serviced (cost to be determined) before we move it to NEBH. We'll first check this radio out to see if it might have any physical damage, water leaks, or flaky electrical connections. One possibility is just a failing power supply, which has been a chronic problem with all of the DragonWave radios for some reason. I've added the LAN-TEL team to this response, since we're coordinating with them on this work.

Once we have a solid connection via NEBH to Brookline, then we'll be able to force routing to your consoles in such a way as to avoid any of the routing events that cause the consoles to think they've lost connectivity to the Core. I am reasonably confident that we can completely resolve these issues for you going forward when these changes are completed.

Finally, Scott I can provide a means for you to remotely disconnect your consoles from the Core, or you can call me to make this change remotely. We can also restore connectivity remotely as appropriate.

Scott,

Just to confirm, I did set the routing metrics quite high for the DragonWave Horizon link between Brookline Town Hall and Egleston Tower (Walnut Park). Consequently, Brookline's application traffic (e.g., Consoles, CJIS, BRIC) will only flow via Egleston if the primary Mimosa link via MIT were to fail. This should prevent a recurrence of the problem you encountered last night, and I believe it would be safe to re-connect to the Core, again.

In addition to the problems observed last evening and into the early hours this morning, I have found other worrisome, and rather bizarre problems with this link. However, I'm still exploring what the root cause might be, and will update when we have a better handle on things.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution
Attachment(s): "smime.p7s"

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up. After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.
- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed

CamPS-SwA switch.

- 07/10 02:49

CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.

However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.

- 07/10 03:35 (approximate)

After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.

Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoration. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Subject: Re: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Hi Chuck,

Thanks for the detail on what went down.

Can you give us an estimate on how many man hours it will take to get Healy up to par?

Our team can certainly help with the physical rack/stack removal type work on the 5th Floor.

Thank you again,

Glenn

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoration of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.

Chuck,

Since Verizon has stopped providing Frame Relay service, Cambridge needs another alternate route for DCJIS. We'd like to appropriate one of the [REDACTED] addresses to assign to the Contivity 1100 CJIS router. We would be patching the Contivity 1100 directly to the Comcast equipment in order to reduce the points of failure.

Can you provide me with a list of used/available addresses on that subnet?

Thanks,
Ken

- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoration. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Subject: Re: PSnet: After-incident report on Cambridge switch outage and impact/resolution
Attachment(s): "smime.p7s"

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could fail at any time. The services that need to be moved are:
 - FATPOT currently running on a dedicated PowerEdge server. This project was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.
 - Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools used for things like firmware updates or config/data captures.
- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.
- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8

Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12
Total:	72

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers.

Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up. After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.
- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could fail at any time. The services that need to be moved are:
 - FATPOT currently running on a dedicated PowerEdge server. This project was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.
 - Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools used for things like firmware updates or config/data captures.
- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.

- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8
Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12
Total:	72

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers. Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up. After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.
- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure. Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern.

However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Chuck plan on moving forward I am finalizing final approval with OEM to fund this separately from approved PSNet budget.

It would need to be complete before the end of July.

Hopefully Monday we will have the green light, it will be limited to Healy for project scope.

Thanks for your assistance.

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could fail at any time. The services that need to be moved are:
 - FATPOT currently running on a dedicated PowerEdge server. This project was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.
 - Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools used for things like firmware updates or config/data captures.
- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring

Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.

- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8
Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12
Total:	72

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers.

Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately

confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up.

After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.

- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored. However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this

task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoration of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.

- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up.
After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.
- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to

also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could fail at any time. The services that need to be moved are:
 - FATPOT currently running on a dedicated PowerEdge server. This project

was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.

- Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools used for things like firmware updates or config/data captures.
- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.
- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8
Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12
Total:	72

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers.

Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am

providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated. Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up. After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.
- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data

center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.

- 07/10 03:35 (approximate)

After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.

Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CampPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CampPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the

critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

Eamon,

I'm just confirming that, after our conversation on Friday, my partners and I are working to accomplish as much of the agreed tasking as we can before July 21, including the Cambridge Healy cleanup. The other work includes restoring the microwave link into Brookline via NEBH, some necessary security upgrades for a subset of the Ubiquiti radios in PSnet/CIMS, and problem resolution work as necessary (e.g., Quincy HS switch issue).

One point to note. Colin has commitments that make him unavailable for PSnet work through Thursday of this coming week, and Fred only has partial availability through the end of this month due to other commitments. However, we should still be able to make substantial progress.

- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.
- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8

Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12
Total:	72

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers.

Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated. Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up. After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it

could be brought online with the redundant power supply.

- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause

service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Chuck,

After consulting with Chief Reardon and Scott Wilder, accomplishing the Cambridge Healy site task is the highest priority. Please work to complete the Cambridge cleanup work before tackling anything else.

Also, one minor correction from your email: We have until **July 31st** not July 21st.

Thanks,
Eamon

Eamon,

I'm just confirming that, after our conversation on Friday, my partners and I are working to accomplish as much of the agreed tasking as we can before July 21, including the Cambridge Healy cleanup. The other work includes restoring the microwave link into Brookline via NEBH, some necessary security upgrades for a subset of the Ubiquiti radios in PSnet/CIMS, and problem resolution work as necessary (e.g., Quincy HS switch issue).

One point to note. Colin has commitments that make him unavailable for PSnet work through Thursday of this coming week, and Fred only has partial availability through the end of this month due to other commitments. However, we should still be able to make substantial progress.

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could fail at any time. The services that need to be moved are:
 - FATPOT currently running on a dedicated PowerEdge server. This project was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.
 - Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools used for things like firmware updates or config/data captures.
- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has

been for some time), so all Cambridge connectivity to DCJIS services was lost.

- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up.
After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.
- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available.
Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea.
Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working.
Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going

through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining

resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Attachment(s): "smime.p7s"

Eamon,

Yes, I had a typo and did mean the 31st.

At this point, the immediate priority is resolving the Quincy High School problems, as they are down to one microwave link with an equipment failure. I've got to go on site to resolve the problem, and will be heading there shortly.

In the meantime, Colin is starting work on the Healy cleanup, and I've also been preparing for this job over the weekend. Colin will have limited availability until Friday, but should be able to get some important pieces in place.

I don't want to lose momentum on the NEBH microwave link, as this is now scheduled for Wednesday, and Brookline is in the same situation as Quincy, with essentially only one working microwave link into the PSnet backbone.

At the same time, we will maintain forward progress on the Healy work, and I expect to have some of the most critical issues resolved by this coming weekend, if not sooner.

I will keep everyone updated as we make progress...

On Jul 15, 2016, at 08:33, Chuck Wade <Chuck@Interisle.net> wrote:

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could fail at any time. The services that need to be moved are:
 - FATPOT currently running on a dedicated PowerEdge server. This project was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.
 - Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools used for things like firmware updates or config/data captures.
- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are

used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.

- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.
- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8
Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers.

Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that

there were significant reachability issues into PSnet via the VPN connection.

- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up. After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.
- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoral. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for

redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the

region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could

fail at any time. The services that need to be moved are:

- FATPOT currently running on a dedicated PowerEdge server. This project was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.
- Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools used for things like firmware updates or config/data captures.
- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.
- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will

need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8
Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12
Total:	72

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers.

Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch

failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoral of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down.
The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up.
After discussion of various options, it was decided that Chuck would head into Cambridge

with a replacement switch and redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.

- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored. However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoration. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well

as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now

plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

Subject: PSnet: Update on Quincy HS status--connectivity fully restored

Attachment(s): "Quincy PSnet map 2016-07-18 at 9.49.10 PM.png", "smime.p7s"

Eric, Joe,

The Quincy High School site is now fully functional again, and is actually in better shape than ever. I successfully replaced the failed Cisco 3550-12G switch, and implemented a slew of configuration enhancements and refinements. The microwave link to Winthrop is again carrying traffic.

Because this was one of the first sites we deployed with redundant switches back in the summer of 2013, the firmware that was running on these switches was a prior version from what we use nearly everywhere else in PSnet. Since I have had some problems with this prior firmware version, I also replaced the other 3550-12G switch so that both are identical in terms of configuration and firmware. It is possible that the switch failure was due to this older firmware. I'll have to check this out in our lab. As an aside, I believe the last site where we still have switches on the prior firmware release is Quincy Fire Alarm. I intend to upgrade firmware on these switches as soon as we can get this scheduled.

I will note that I ran into some odd problems with routing through the 35 Northampton site. While I found some configuration issues that needed to be resolved, some of the problems I observed were just inexplicable. As a result, you may have encountered some brief loss of connectivity to CJIS or other services accessed via PSnet as I worked through these issues. I do believe that I've implemented adequate workarounds and safeguards so that I expect everything to be stable going forward. When the new fiber is in place, we can take some further steps to improve resilience and overall stability.

Another change worth noting is that Eric and I changed over the fiber connection from the High School site to terminate on the PSnet switches in the Coddington data center instead of being patched directly through to the Police HQ. There are two fiber connections from Coddington to the Police site, so this improves redundancy. Unfortunately, one of the BiDi GBIC fiber transceivers had failed, so we still have only one connection from the HS to Coddington. By using BiDi GBICs I was hoping to have each HS switch with its own connection to Coddington. I'll order a replacement GBIC and get this to you within a couple of weeks.

One reason for running the fiber connection through the Coddington data center is that this is the hub for Quincy's fiber plant. This means that we have more options for fiber paths out of this facility, and nearly all of the other sites are connected directly to Coddington, including North Quincy HS. This will allow us to get the most benefit from the new fiber connection into Boston via North Quincy HS.

I have attached the updated InterMapper Quincy map showing the current state of all PSnet switches and interconnections within Quincy. This shows the new connection from the HS to the Coddington data center.

Let me know if you have any further questions or would like more details on anything.

Subject: PSnet: Microwave Link between Schroeder Plaza and NE Baptist Hospital has been restored
Attachment(s): "smime.p7s"

Scott, et al.,

The LAN-TEL/Interisle team succeeded in replacing the dead BridgeWave 80G microwave link between Schroeder Plaza and NE Baptist Hospital with a new microwave link based on Ubiquiti AirFiber24 radios operating in the unlicensed 24 GHz band. This is new technology that has earned a solid reputation for links similar to this one. While the BridgeWave delivered 1 GHz of capacity, the new AirFiber24 comes close at over 700 Mbps, which is considerably more than we need.

The most important benefits to having this link back up are that (1) we now have another working microwave link out of the critical Schroeder Plaza site, (2) we have a new path into Brookline via NEBH, and (3) Brookline is no longer reliant on the Egleston Tower (Walnut Park) site so that we can accommodate the restructuring of this site. Not only is Brookline a beneficiary, but Cambridge, including MIT and Harvard, will also get benefits from having an alternative path that can backup the Courthouse link.

As an aside, while deploying this new AirFiber24 link, we also made some network infrastructure improvements at Schroeder Plaza that will improve reliability and manageability of the DragonWave link to Cambridge Courthouse. We have a few more tweaks to make, and we want to improve the power connections as soon as the new UPS is online for the wiring closet where this equipment resides.

When we've completed the network and server cleanup at the Cambridge Healy site, we can then improve the routing schemes for Brookline to allow Console traffic to flow over two distinct paths, which should resolve the Motorola MCC7500 console problems when the network performs traffic rerouting.

The bottom line is that this new link is up, and it is passing traffic.

Thanks to Mark and Jim from LAN-TEL for getting this job done in a single day. Also, the folks at Schroeder Plaza were quite helpful and gracious in providing us what we needed for the network upgrades that were implemented.

The LAN-TEL/Interisle team succeeded in replacing the dead BridgeWave 80G microwave link between Schroeder Plaza and NE Baptist Hospital with a new microwave link based on Ubiquiti AirFiber24 radios operating in the unlicensed 24 GHz band. This is new technology that has earned a solid reputation for links similar to this one. While the BridgeWave delivered 1 GHz of capacity, the new AirFiber24 comes close at over 700 Mbps, which is considerably more than we need.

The most important benefits to having this link back up are that (1) we now have another working microwave link out of the critical Schroeder Plaza site, (2) we have a new path into Brookline via NEBH, and (3) Brookline is no longer reliant on the Egleston Tower (Walnut Park) site so that we can accommodate the restructuring of this site. Not only is Brookline a beneficiary, but Cambridge, including MIT and Harvard, will also get benefits from having an alternative path that can backup the Courthouse link.

As an aside, while deploying this new AirFiber24 link, we also made some network infrastructure improvements at Schroeder Plaza that will improve reliability and manageability of the DragonWave link to Cambridge Courthouse. We have a few more tweaks to make, and we want to improve the power connections as soon as the new UPS is online for the wiring closet where this equipment resides.

When we've completed the network and server cleanup at the Cambridge Healy site, we can then improve the routing schemes for Brookline to allow Console traffic to flow over two distinct paths, which should resolve the Motorola MCC7500 console problems when the network performs traffic rerouting.

The bottom line is that this new link is up, and it is passing traffic.

Thanks to Mark and Jim from LAN-TEL for getting this job done in a single day. Also, the folks at Schroeder Plaza were quite helpful and gracious in providing us what we needed for the network upgrades that were implemented.

Great news, finally a back link we can rely on.

My next question, do we feel the links are stable, do I dare plug back into the radio core?

Sounds like a lot of positive progress is being made across the region, thanks to all involved,

Shed light on some of the key metrics of body worn video

To date, most law enforcement organizations have chosen to use cloud-based storage solutions for their body-worn video. As storage prices have dropped, this has become an increasingly cost-effective solution. However, there is a growing interest in keeping storage closer to home given all of the data coming from early adopters. This webinar will shed light on some of the key metrics of body worn video so you will have a better understanding of how policy considerations will affect storage volumes, what you can expect to need to plan on for temporary and long-term storage (it's less than you may think) and why local and hybrid options may save you 10's or 100s of thousands of dollars on an annual basis.

Attachment(s): "smime.p7s"

Scott,

While the PSnet connection to Brookline has been quite stable this week, we do believe that stability should be improved significantly with the new link via NEBH back in operation. However, I won't be able to get to updating routing to force each GGM8000 in Brookline to have a different default path back to Schroeder until next week. Since we will be making a few changes today and tomorrow that might affect routing, the safe approach would probably be to hold off until at least Friday afternoon, and it may be easier for you to delay reconnecting until next Monday. That said, you could reconnect to the Core at any time, and I believe network connectivity to Schroeder will be stable.

With the new NEBH path in place, Fred has now updated the firmware on the Mimosa B5 link to MIT Tang Hall. This seems to be working well, and it offers several technical refinements that we believe should further enhance performance and stability for this link. This updated firmware will also allow us to resume SNMP monitoring of these Mimosa radios, and that should allow us to better track performance. As an aside, we are already monitoring the new AirFiber24 radios via SNMP, and we're actually anxious to see how these radios perform during a heavy shower. Maybe we'll get a thundershower later in the day on Friday, and it would be nice if it would be intense so we can test this new link. We could use the rain, anyway. :) As an aside, I'm still drying out my tools and parts bags from having gotten caught in a very intense thunderstorm when leaving Quincy HS on Monday--if felt like walking through a waterfall.

Finally, I will note that some of the changes I'll be implementing in Cambridge will also help with refining routing and network stability for Brookline, since one of your paths is through Cambridge. I will keep you in the loop as we make progress, and I will advise if any anticipated work could affect Brookline consoles.

As a reminder, we are able to disconnect and reconnect your GGM8000s into PSnet at any time. I mention this so you can avoid driving in at odd hours to perform a disconnect. Hopefully, we'll soon be able to put this issue behind us.

Subject: PSnet: Microwave Link between Schroeder Plaza and NE Baptist Hospital has been restored

Scott, et al.,

The LAN-TEL/Interisle team succeeded in replacing the dead BridgeWave 80G microwave link between Schroeder Plaza and NE Baptist Hospital with a new microwave link based on Ubiquiti AirFiber24 radios operating in the unlicensed 24 GHz

band. This is new technology that has earned a solid reputation for links similar to this one. While the BridgeWave delivered 1 GHz of capacity, the new AirFiber24 comes close at over 700 Mbps, which is considerably more than we need.

The most important benefits to having this link back up are that (1) we now have another working microwave link out of the critical Schroeder Plaza site, (2) we have a new path into Brookline via NEBH, and (3) Brookline is no longer reliant on the Egleston Tower (Walnut Park) site so that we can accommodate the restructuring of this site. Not only is Brookline a beneficiary, but Cambridge, including MIT and Harvard, will also get benefits from having an alternative path that can backup the Courthouse link.

As an aside, while deploying this new AirFiber24 link, we also made some network infrastructure improvements at Schroeder Plaza that will improve reliability and manageability of the DragonWave link to Cambridge Courthouse. We have a few more tweaks to make, and we want to improve the power connections as soon as the new UPS is online for the wiring closet where this equipment resides.

When we've completed the network and server cleanup at the Cambridge Healy site, we can then improve the routing schemes for Brookline to allow Console traffic to flow over two distinct paths, which should resolve the Motorola MCC7500 console problems when the network performs traffic rerouting.

The bottom line is that this new link is up, and it is passing traffic.

Thanks to Mark and Jim from LAN-TEL for getting this job done in a single day. Also, the folks at Schroeder Plaza were quite helpful and gracious in providing us what we needed for the network upgrades that were implemented.

Chuck, Understood, I can wait until the routing is complete, another week disconnected is not an issue for us.

Now, you mention a remote disconnect option, is that something I can do when needed?

Because these issues always take place between 1 and 3 A.M. \ I don't think you want me calling you at those hours to disconnect,

so if there is a way I can do it remotely in the future that would be great.

Thanks,

Scott

While the PSnet connection to Brookline has been quite stable this week, we do believe that stability should be improved significantly with the new link via NEBH back in operation. However, I won't be able to get to updating routing to force each GGM8000 in Brookline to have a different default path back to Schroeder until next week. Since we will be making a few changes today and tomorrow that might affect routing, the safe approach would probably be to hold off until at least Friday afternoon, and it may be easier for you to delay reconnecting until next Monday. That said, you could reconnect to the Core at any time, and I believe network connectivity to Schroeder will be stable.

With the new NEBH path in place, Fred has now updated the firmware on the Mimosa B5 link to MIT Tang Hall. This seems to be working well, and it offers several technical refinements that we believe should further enhance performance and stability for this link. This updated firmware will also allow us to resume SNMP monitoring of these Mimosa radios, and that should allow us to better track performance. As an aside, we are already monitoring the new AirFiber24 radios via SNMP, and we're actually anxious to see how these radios perform during a heavy shower. Maybe we'll get a thundershower later in the day on Friday, and it would be nice if it would be intense so we can test this new link. We could use the rain, anyway. :-). As an aside, I'm still drying out my tools and parts bags from having gotten caught in a very intense thunderstorm when leaving Quincy HS on Monday--if felt like walking through a waterfall.

Finally, I will note that some of the changes I'll be implementing in Cambridge will also help with refining routing and network stability for Brookline, since one of your paths is through Cambridge. I will keep you in the loop as we make progress, and I will advise if any anticipated work could affect Brookline consoles.

As a reminder, we are able to disconnect and reconnect your GGM8000s into PSnet at any time. I mention this so you can avoid driving in at odd hours to perform a disconnect. Hopefully, we'll soon be able to put this issue behind us.

Subject: PSnet: Microwave Link between Schroeder Plaza and NE Baptist Hospital has been restored

Scott, et al.,

The LAN-TEL/Interisle team succeeded in replacing the dead BridgeWave 80G microwave link between Schroeder Plaza and NE Baptist Hospital with a new microwave link based on Ubiquiti AirFiber24 radios operating in the unlicensed 24 GHz band. This is new technology that has earned a solid reputation for links similar to this one. While the BridgeWave delivered 1 GHz of capacity, the new AirFiber24 comes close at over 700 Mbps, which is considerably more than we need.

The most important benefits to having this link back up are that (1) we now have another working microwave link out of the critical Schroeder Plaza site, (2) we have a new path into Brookline via NEBH, and (3) Brookline is no longer reliant on the Egleston Tower (Walnut Park) site so that we can accommodate the restructuring of this site. Not only is Brookline a beneficiary, but Cambridge, including MIT and Harvard, will also get benefits from having an alternative path that can backup the Courthouse link.

As an aside, while deploying this new AirFiber24 link, we also made some network infrastructure improvements at Schroeder Plaza that will improve reliability and manageability of the DragonWave link to Cambridge Courthouse. We have a few more tweaks to make, and we want to improve the power connections as soon as the new UPS is online for the wiring closet where this equipment resides.

When we've completed the network and server cleanup at the Cambridge Healy site, we can then improve the routing schemes for Brookline to allow Console traffic to flow over two distinct paths, which should resolve the Motorola MCC7500 console problems when the network performs traffic rerouting.

The bottom line is that this new link is up, and it is passing traffic.

Thanks to Mark and Jim from LAN-TEL for getting this job done in a single day. Also, the folks at Schroeder Plaza were quite helpful and gracious in providing us what we needed for the network upgrades that were implemented.

Attachment(s): "smime.p7s"

Scott,

One of the things we would like to do is to implement a set of scripts that designated individuals from the communities could execute to accomplish things like disconnecting consoles from the Core. While it is trivial for me to go into one of our switches or other devices and perform an operation to, for example, shut down an interface, this might not be easy for people who don't regularly do things like this. There are also some security concerns we need to address, as such actions obviously have significant impact.

In the meantime, try calling me anyway, no matter the time of day or night. It's still easier for me to perform the remote operation than you driving into Brookline in the wee hours. My office number is probably the best to use in the middle of the night, as I use the "do not disturb" feature on my mobile phone during sleep time (due to all the robo calls and wrong numbers).

I'll also look into a way I can give you a manual script to perform these operations in the near term.

Subject: Re: Cameras down / power problem

Ramon,

First, we agree with you that this configuration is not ideal. There is some history, here, though. The reason this equipment is located in your office is that is where the fiber from the EOC building terminates. The weak link is (and always has been) the fiber optic media converter. I have personally eliminated dozens of these from PSnet/CIMS as I've installed Cisco switches with integral GBIC fiber transceivers. Not only do these stand-alone media converters get hung up, they are unmanaged, so they represent blind spots for us in monitoring the network.

Back in the 2010 timeframe, I made some improvements to this situation when the first Cisco 3550-12G was installed. This allowed us to eliminate the media converter in the EOC radio room, and so we can monitor link status. At the same time, I added the RB250G, since this is a managed switch (actually, about \$60 for this switch at the time, not \$10). Unfortunately, there were no inexpensive managed switches with direct fiber interfaces when I made this upgrade, though there is now an RB260GS that does have an SFP slot for direct fiber interfaces.

Here is a snippet from our InterMapper map showing this connection through your office:

The Chelsea_CH_RB250 that shows in yellow (this is an SNMP polling issue) is the 5-port switch in your office. We can't monitor the media converter, since there's no way to talk to this device, as it is totally dumb. The connections to the camera microwave radios in the City Hall cupola can be described as:

PSnet CamEOC-SwB interface port Gi0/7 <=multi-mode fiber=> media converter <=copper patch=> Chelsea_CH_RB250 ... <=copper cable to cupola=> Chelsea City Hall switch (Canopy CMM switch in cupola) <=> microwave radios to cameras

The multi-mode fiber and the cable from your office to the cupola were deployed by the City of Chelsea back when the original camera system was deployed. The Canopy switch in the cupola was also part of the original deployment.

We can upgrade the equipment in your office to eliminate the media converter. We would probably use equipment from available spares, unless you prefer that the City install its own equipment. However, our objective would be to improve management of the connection to the cupola, so we would want to make sure that we can at least SNMP poll whatever gets installed. In our spares, we have HP ProCurve 2510-24 switches that are fanless and reliable, or alternatively I could deploy an RB260GS switch in lieu of the RB250G that would replace the media converter with a managed fiber SFP. We should also replace the Canopy switch in the cupola with a more modern Layer 2 managed switch. The Canopy switch is no longer needed for any Canopy microwave radios.

Finally, we also agree that all such equipment should be powered through a UPS, and we believe strongly that every UPS should be managed and actively monitored. As I recall, there was a UPS powering the equipment located in your office area when I installed the RB250G. However, it was just another SOHO UPS, and it is unlikely that it would have lasted this long. I do not know whether there is a UPS for the equipment in the cupola, but it would be a good idea to have a managed UPS installed there as well.

On 7/25/16 8:24 AM, Garcia, Ramon wrote:

Can someone send me some sort of documentation/diagram of how this is connected? It's hard for me to believe that we rely on a small fiber transceiver and \$10 hub for our camera solution. Harder to believe that this is in my office, with no AC or proper UPS.

I see an opportunity to improve this. I'm open to suggestions. Still would appreciate any documentation that can be provided so I can understand better all connection points and relate to physical locations. It will help to prioritize and add to our list of items to check when there are power outages.

On Jul 23, 2016, at 11:00 AM, Chuck Wade <Chuck@Interisle.net> wrote:

Folks,

Our InterMapper map for Chelsea shows that the fiber optic link from the PSnet switches in the EOC radio room is down. However, this appears to be a problem with the fiber optic media converter that is located in the IT room in the basement of City Hall (i.e., next to Ramon's office). This media converter connects to a small 5-port "RB250G" switch, that in turn connects to another switch in the City Hall Cupola, where the microwave radios are located.

My suggestion is to check power to the media converter and RB250G switch in the IT room. I can provide guidance on where these two small devices are located (or were located). Both of these devices are a bit bigger than a deck of cards. The media converter is a black box with red accents and it may be labeled "Optolinx." The RB250G is a white plastic box with five Ethernet ports.

Assuming these devices have power, then probably the first thing to try would be to power cycle the media converter. It has a DC power jack on the back that can be easily removed and re-inserted after 10 seconds. I'm happy to get on the phone with someone to try some other possible tricks to restoring this link.

If the media converter has failed (which would not surprise me), then I have spares, and could replace both the media converter and RB250G with a single box for added reliability.

Feel free to call me. I'll be in my office all day...

Hello Kate, just to clarify, did you make the change in the City of Boston Supplier Portal? If so, did you add the Building 3, Suite 3100 address? It may take a few days to populate in the system. I can probably submit the payment with a note for Treasury if you've definitely entered the new address. Thank you.

Subject: Fwd: Lan-Tel Remit Address

Hi Kate and Vickie,

Please see below. I believe this may be a result of the new HQ you recently opened. Can the representative from Lan-tel who manages the City of Boston Vendor profile please update to add the new remit to address so we can make payment for outstanding invoices?

Thanks in advance,

Deirdre

----- Forwarded message -----

From: Albert Parker <albert.parker@boston.gov>

Date: Tue, Jul 26, 2016 at 10:30 AM

Subject: Lan-Tel Remit Address

To: Eamon Miller <eamon.miller@boston.gov>

Cc: Deirdre Habershaw <deirdre.habershaw@boston.gov>

Eamon, Lan-Tel Communications (ID 0000019146) has a discrepancy on their account in BAIS. The account shows this address as remit:

Lan-Tel Communications Inc.,

1400 Providence Highway, Suite 2000

Norwood, MA 02062

Their invoices show:

1400 Providence Hwy
Building 3, Suite 3100
Norwood, MA 02062

This second address has not been entered into their BAIS account. Auditing may or may not reject payments as the address is very similar, but not the same.

Lan-Tel needs to either change the invoice and accept checks at the first address or they have to correct the remit in BAIS.

Can you please contact them ASAP so we can avoid issues paying their invoice for PO 668252?

GOING FORWARD PLEASE CHECK REMIT ADDRESSES FOR YOUR VENDORS.

Thanks,

Albert Parker

Subject: Ubiquiti radios now secured

As everyone knows by now, Ubiquiti AirOS contained some vulnerabilities that came from the underlying Linux code. This was patched starting in release 5.6.2 in early 2015. This spring, a virus attacking unpatched Ubiquiti radios began to spread across the Internet, and sometimes got into private networks. This made updating rather important.

I have now completed updating the PSnet/CIMS radios to secure versions. Most of the recent updates are to the current v5.6.6. We should have no radios capable of being compromised on the air.

Some of the radios transferred to BoNet are no longer under our control and we don't know if they've been updated. The PSnet AirControl system, which does the patching, also sees the Milton network, and that is still unpatched, at v5.5.9. I don't know if it has any exposed attack surfaces. Updates are quite easy with AirControl.

Thanks Fred, for getting this done. Do you know, did we have any issues from the virus?

I am wondering if the virus found it'd way to these units, now you have them patched we are good, but was there any evidence that these units were effected?

Thanks,
Scott

Hi Kate,

The payments that I have applied to the \$700,00 PO total \$187,202 leaving a remaining balance of \$512,798. Does that sound correct to you? this does not include any activity for July, which we have not been invoiced for yet.

Hope you are both well,

Subject: PSnet: Update on Cambridge Healy site restructuring

Attachment(s): "smime.p7s"

Eamon,

With a sense of relief, I am confirming that we have accomplished much of the planned restructuring of the Cambridge Healy PSnet site, and pretty much all that had planned for July. This includes moving all network connections from a set of older switches to a newer 3750G switch stack that also supports the HP Blade Servers and 3PAR storage system. The older switches have been decommissioned, and may get redeployed to other sites at some point. In particular, we are no longer reliant on the central 3550-12G switch that had its power supply fail just before midnight on July 9th.

In the process of moving all network connections, we also had to review a lot of network config issues, which allowed us to find and correct a series of problems that have been of concern, especially for the P25 radio systems at his site. The required corrections extended to network switches at the Cambridge Fire and 300 Bent Street sites. Many configuration refinements were introduced to improve service quality and overall resilience. The reason we feel some relief is that we've eliminated the mysteries that had accumulated at this site, along with some of the accumulated baggage and clutter. As a reminder, this site included equipment from two other sites in addition to the original Healy installations. The improvements will not only benefit Cambridge, they will also benefit the entire region, since this is one of our two hosting centers. Brookline, Somerville, MIT, and Harvard will obtain the most benefits from improved network reliability, and maintainability!

In addition to redoing all network connections and switch configurations, we added a redundant power system for the 3750G switch stack. This means that we will survive any failures of internal power supplies in these switches.

Along with the network changes, we worked with the FATPOT team to complete the transition of the FATPOT application from the old server to a new Virtual Machine running on the HP Blade System. This transition seemed to go smoothly, thanks to the joint planning done by Colin and the FATPOT team. We seem to have dodged a bullet on this, as the old FATPOT server system is now indicating an error condition for partial disk drive failure in its RAID system. Total failure of the RAID disk system on this system is imminent, but no longer a concern.

We also established a new Ubuntu server VM for providing "Infrastructure" services that are vital to PSnet operations. As a first step to eliminating the last of the old servers, we moved the system logging service (a.k.a., syslog) off the old "infrastructure server" onto this new VM. We had been reducing the amount of logging from network equipment due to the fragility of the old server, and we now have the ability to collect logs from all PSnet equipment. All Cisco switches (over 100!) were updated to use this new syslog service. Not only is this a vital tool for detecting and analyzing problems, it is also necessary for system audits. Once we resume work under the new contract, we intend to complete the move of all infrastructure services to VMs running in the Cambridge and Boston hosting centers.

At this time, we have powered off six older Dell servers, and have only three still operational. However, only one is currently in use for a subset of infrastructure services. When we complete the migration of the last of these services, we'll work with City staff to remove at least eight of these servers (only one is worth keeping). This will free up significant rack space for other purposes. We've already made a lot more rack space available with the network cleanup work.

Let me know if you have any questions...

Eamon,

I'm just confirming that, after our conversation on Friday, my partners and I are working to accomplish as much of the agreed tasking as we can before July 21, including the Cambridge Healy cleanup. The other work includes restoring the microwave link into Brookline via NEBH, some necessary security upgrades for a subset of the Ubiquiti radios in PSnet/CIMS, and problem resolution work as necessary (e.g., Quincy HS switch issue).

One point to note. Colin has commitments that make him unavailable for PSnet work through Thursday of this coming week, and Fred only has partial availability through the end of this month due to other commitments. However, we should still be able to make substantial progress.

On Jul 15, 2016, at 08:33, Chuck Wade <Chuck@Interisle.net> wrote:

Glenn, et al.,

I have been evaluating our options for cleaning up the Cambridge Healy site and trying to get a handle on how much effort will be involved. While we have recognized the need to restructure this site, the amount of effort required to do so has been an impediment. One reason this is not a typical restructuring exercise is that there are a lot of critical services at this site, and we need to rework everything with minimal disruption--ideally, no service disruptions. On the positive side, we've actually been whittling away at this problem over the past three years, and a lot of pieces have been put in place for the new structure, while out-of-date systems have gradually been taken off-line.

There are several, tightly interrelated systems that need to be restructured, including:

- Moving several core PSnet services off two old Dell PowerEdge 1850 servers onto Virtual Machines (VMs) running on the new blade servers. This will then allow us to decommission these old servers, either of which could fail at any time. The services that need to be moved are:
 - FATPOT currently running on a dedicated PowerEdge server. This project was underway at the time our contract ran out, and should be ready to complete. There is a dependency on the FATPOT team to complete this cutover.
 - Multiple "infrastructure" services running on another PowerEdge server ("NMS1"), including RADIUS (account-based authentication service), system logging, RANCID configuration management, SmokePing latency monitoring, and various tools

used for things like firmware updates or config/data captures.

- Establishing a robust VPN remote access service based on supported hardware/software. Currently, several old SOHO-style firewalls are used to provide these services, and they can all be easily replaced with a single PowerRouter 732 (MikroTik) system. This would be consistent with what we currently have deployed at Schroeder Plaza, and should be established with an eye to site diversity. While there is a need to establish a much more comprehensive VPN remote access service, the immediate objective will be to consolidate the current hodge podge of multiple boxes into a single, supportable system.
- With the above steps completed, we will no longer need two Cisco 24-port switches, and these can be decommissioned. Any connections into these two switches that are still needed will be moved to other switches.
- We previously deployed a Cisco 3750G switch stack for the HP Blade and 3PAR storage systems. The intent was to also use this switch stack to replace the "CamPS-SwA" Cisco 3550-12G switch that lost its power supply this past weekend. Note that we're still operating on this switch, but using an external power supply. Because of the critical role of the original 3550-12G switch, this cutover needs to be handled with great care so as to not disrupt other services (even outside of Cambridge) and to avoid impacting critical radio/console systems.
- We should also restructure some of the inter-switch trunking within Healy to improve redundancy and resilience.
- There is a console server installed at Healy for back door management of critical systems. This needs to be upgraded, and then reconnected to the remaining systems after the cleanup. This would bring Cambridge Healy up to the capability currently deployed at the mirror Schroeder Plaza site.
- Documentation must be updated to reflect the new structure at Healy before this project can be declared complete. Note that the lack of documentation is one reason things got out of control at this site, and has been a source of countless hours spent trying to figure out how things were actually configured to inter-work. This problem was compounded when two other Galaxy sites were folded into the Healy site in a rush.

There are several ways we can approach this restructuring and cleanup exercise. An immediate priority will be to decommission the old 3550-12G switch (CamPS-SwA) and move its connections and network role over to the newer 3750G switch stack. However, like a tangled mess of twine, we will need to unravel all the issues summarized above before this site will be in proper shape.

This project will not require any new capital outlays, though there may be some minor materials expenses. On the other hand, there is a lot of labor required. My best estimate at the moment is that the effort could break out as follows:

Task	Labor (est)
Complete cutover of FATPOT server to VM	8
Move infrastructure services off "NMS1" server onto VMs	24
Set up new VPN remote access system, and transition existing services over	12
Decommission CamPS-SwA 3550-12G (involves re-working multiple switch configs throughout Cambridge due to routing dependencies)	12
Upgrade console server and re-connect to new structure	4
Documentation and updating InterMapper maps	12

Note that I did not include any labor in the above estimates for removal of old equipment, as you graciously offered to handle this task. We will, of course, work with the Cambridge team on identifying equipment to be removed, and assist with any re-cabling or power distribution.

While I hope we can accomplish this restructuring for less than the time estimated above, I want to be realistic. The good news is that the end result will improve reliability and maintainability of the system, and not just for Cambridge. This will benefit the entire Region, given the importance of this site as both a core network site, and one of our two hosting centers.

Finally, I should also note that there is some restructuring that needs to be done at the Schroeder Plaza site as well. In particular, there is a single 3750G-24 switch at Schroeder that was originally deployed in a manner similar to the CamPS-SwA switch in Cambridge, and its role needs to be subsumed into the 3750G switch stack at Schroeder that is the mirror to the switch stack in Cambridge. Fortunately, this is a smaller effort, but there are some other issues at Schroeder that need to be addressed in order to improve system reliability and maintainability.

Let me know if you have any questions or would like further information on this proposed plan of action.

Subject: PSnet: After-incident report on Cambridge switch outage and impact/resolution

Stephen, Ken, et al.,

The purpose of this memo is to summarize the nature of the network incident that affected Cambridge CJIS access and NICE Inform services, along with other system problems, including loss of InterMapper services and VPN access to PSnet. I am providing a chronology of the problem, and consequent resolution, along with an assessment. I will also provide some recommendations for preventing such events in the future.

Synopsis

Saturday evening at ~23:06, a network switch failure in the 5th floor server room at Cambridge Healy resulted in loss of CJIS services for Cambridge and disrupted NICE Inform services. In addition, the primary PSnet InterMapper system is located at this facility, and became disconnected after the switch failure. Further compounding problems, VPN access to PSnet currently goes through this same switch.

On-site deployment of a redundant power supply restored the PSnet switch to full service with a total outage time of 3 hours and 44 minutes. However, problems with the Nortel Contivity 1100 router used for communications to the EOPSS/DCJIS data center in Chelsea delayed restoration of CJIS services for Cambridge by another hour. By around 03:45, all services were fully restored, including CJIS and NICE Inform services. InterMapper and VPN remote access services were restored as of 02:49.

Chronology of Events and Recovery

- 07/09 23:05:52
CamPS-SwA Cisco 3550-12G switch failed (power supply failure)
This is the core switch at the Cambridge Healy Facility
InterMapper network connectivity was disrupted by this switch failure, which meant that InterMapper alerts were not going out.
- 07/09 23:43:33
Cambridge staff received notification from their WhatsUp monitoring system that CJIS connectivity via PSnet was down. The Verizon Frame Relay connection was also down (probably has been for some time), so all Cambridge connectivity to DCJIS services was lost.
- 07/10 00:13
Ken Pitts forwarded WhatsUp notice to Chuck Wade
- 07/10 00:25
Ken Pitts called Chuck Wade, left voice mail regarding problem
- 07/10 00:27
Chuck received Ken's voice message, and began investigating situation. While a VPN connection into PSnet (via Cambridge Healy) was up, there was no access to InterMapper, and simple connectivity tests revealed that there were significant reachability issues into PSnet via the VPN connection.
- 07/10 00:35
Chuck responded to Ken to confirm that these problems were being investigated.
Ken noted that the critical issue was restoring CJIS services, but that that they had also lost access to the City's NICE Inform system. While there had not been any reports of radio system problems, this was an obvious area of concern.
- 07/10 00:35 to 01:25 (approximate)
Chuck established alternative VPN connection into Schroeder Plaza and used backup InterMapper system to confirm suspected outage of CamPS-SwA switch. This also confirmed that Cambridge P25 services were still up through redundant switches.
A call was placed to Stephen Maywalt, who was now on site at Healy Facility. Stephen immediately confirmed that CamPS-SwA was offline, apparently due to power supply failure. All other PSnet equipment at Healy Facility was up.
After discussion of various options, it was decided that Chuck would head into Cambridge with a replacement switch and

redundant Cisco power supply. The working assumption was that if only the switch power supply had failed, then it could be brought online with the redundant power supply.

- 07/10 02:30 (approximate)
Chuck arrived at Healy Facility, and worked with Stephen to install and connect redundant power supply to failed CamPS-SwA switch.
- 07/10 02:49
CamPS-SwA switch booted up, and all connectivity via Cambridge Healy was restored.
However, Cambridge still did not have CJIS services available. Stephen and Chuck determined that the Nortel Contivity router used to provide secure tunnels to the Commonwealth's data center in Chelsea was not coming up correctly. Locally, the DCJIS router (Contivity) brought its Ethernet interfaces up, but was not able to communicate via any of its ports. PSnet connectivity to Chelsea data center was confirmed to be good, but that the Contivity at Cambridge was not responding to tunnel initiation requests from Chelsea.
- 07/10 03:35 (approximate)
After several resets and checks on physical connections, the DCJIS Contivity router finally came online, and we were able to confirm that it had established IPsec tunnels to the DCJIS firewall in Chelsea. Unfortunately, DCJIS Ops had initiated a tunnel reset, so with several application-related issues, CJIS services were not fully restored at Cambridge until about 03:45.
Stephen also confirmed that the NICE Inform system was working. Aside, we need to determine how it is that the PSnet problems disrupted NICE Inform services.

Operational Impact Assessment

There were two problems affecting Cambridge public safety services: (1) failure of the CamPS-SwA switch power supply, and (2) failure of the DCJIS Nortel Contivity router to come up properly after an earlier power cycle of this device to attempt service restoration. Both problems directly impacted Cambridge access to DCJIS services.

The CamPS-SwA switch is actually the first Cisco 3550-12G switch to have been deployed in PSnet (circa early 2009), but it was initially positioned as a "core" switch for Cambridge Healy, with all network connections going through this switch. While additional switches have been added at Cambridge Healy for redundancy, this single switch is still a critical point of failure in the network (see below for recommendations). Unfortunately, multiple servers, firewalls, and VPN gateways located at the Cambridge Healy PSnet Hosting Center are still dependent on this switch, and when it failed the impact was significant. In this case, the tools to diagnose problems were unreachable via Cambridge, and no full-time operational capability yet exists at Boston Schroeder Plaza to provide alternative access to backup facilities. While temporary access was enabled, this added about a half hour to completing situational assessment. Note, in this case, we needed both an alternative VPN connection into PSnet as well as the backup InterMapper server. Normally, the backup IM server is easily reached, but due to the nature of the Cambridge outage, we needed to also establish another way to get to it.

Since Cambridge also reported problems with accessing their NICE Inform system, we need to better understand the relationship of this system to PSnet services, so that this service can be made more resilient.

Fortunately, system redundancy did protect communications to P25 systems in Cambridge, including for Brookline, MIT, and Harvard. Analysis of the outage shows that, while one set of GGM8000 gateways at Cambridge Healy did become disconnected from the network, the redundant gateways never lost connectivity. Apparently, any routing events did not disrupt Console communications to the Core from Cambridge.

Recommendations

To be clear, the PSnet team has long had concerns about this situation at Cambridge Healy with the critical role that this single switch plays. There is no getting around the consequences of "Murphy's Law," and last night the veracity of this Law was again demonstrated. There are at least 84 Cisco 3550-12 switches deployed throughout PSnet, but only this one switch is so critical; and as predicted by old man Murphy, this is the switch that failed. Note that this is only the second instance of an actual hardware failure of one of these switches in an operational context. The other failure was not even noticed due to designed redundancy. The only reason that this situation has not been corrected is that budget constraints have limited work to problems that cause service disruptions. Another factor is that history and accumulated baggage at Cambridge Healy means that a moderate amount of effort is required to restructure the network in a way that eliminates single points of failure.

Consequently, our first recommendation is that restructuring network connectivity at Cambridge Healy be done as soon as feasible. This is one of two core sites along with Boston Schroeder Plaza, and both of these sites also serve as hosting centers. In addition to restructuring network connectivity, a lot of cleanup is also necessary. There are many pieces of equipment in the 5th floor server room that are either duplicative of other equipment (without adding resilience) or that are no longer in service. Probably about two thirds of a rack can be cleaned out. This includes six servers and multiple firewalls and network switches. One challenge with completing this task is that the critical operational nature of the site requires extraordinary care as services are redeployed and rebuilt. At this point, there are no additional capital requirements, just the effort to clean things up.

As a side issue, it is important to review the network requirements for Cambridge's NICE Inform system and implement appropriate measures to improve resilience for this service.

Given the vital role that remote VPN access now plays for the region, another long-delayed initiative needs to be pursued to establish fully-redundant VPN access from both Boston and Cambridge. This is not only important for network support (and CIMS camera support), but also for the Motorola MCC100 deployable consoles. Related improvements to security services (e.g., RADIUS) also need to be addressed. Ideally, VPN access needs to be available via more than one ISP connection. Currently, both Cambridge and Boston sites rely on Comcast cable services.

While considerable progress has been made in establishing and maintaining resilient InterMapper services, there is further work needed to better integrate the Boston and Cambridge InterMapper services, and also complete integration with CIMS camera monitoring via InterMapper. Should we ever lose access to one of PSnet's hosting centers, having access to InterMapper and other tools will be vital to restoring services.

Finally, Murphy's Law is still in play, and we should responsibly address some other areas of exposure. One in particular is that we currently rely on a single gateway at the EOPSS data center in Chelsea. In the past, Verizon's Frame Relay service could be used to recover CJIS communications, so this single point of failure was perhaps not as significant a concern. However, Verizon's FR service can no longer be relied upon, and failure of this one central gateway could take down CJIS services for all of MBHSR. The PSnet connections into the EOPSS data center are partially redundant today, and we have the necessary equipment in hand to build this out as a fully redundant system, so this is just a labor expenditure. We might also use this as an opportunity to leverage fiber connectivity into the Commonwealth's data center.

I am happy to address any questions, or provide further details on any of the issues surfaced in this memo.

...Chuck

Subject: Walnut Park Roof UPDATE

Sir
Under the direction of Mark Savage and Jim Rex of Lan- Tel . The top roof of 1990 Columbus Ave -Walnut Park has been officially cleared of CIMS antennas for BPD cameras , and PSNET Backhauls .

As you know the PSNET router and switch has been relocated to the generator room until a more stable and permanent enclosure can be installed .

For now , most of cameras associated to this hub are back on line . The following will be down until tomorrow :

BH Ave - Humboldt
BH Ave - Seaver
BH Ave - Quincy

Due to these being non - line of site antennas and on the list of the OEM sanctioned upgrade. We will reroute these to closer line of site equipment .

We will also continue to dress newly installed and rerouted cables on the roof in a neat and workmanlike manner .

Could you notify the BRIC of these cameras being offline .

I believe our work will comply to BPD Communications scope of work , and you can seamlessly continue on with your active radio project .

Please call me if you have any questions or concerns.

Respectfully ,

Eric Johnson

Subject: Invoice

Good morning,

I need some clarification on an invoice. The 2 city hall cameras have been installed and we received a bill from Lan-Tel for \$4500.00. This was an approved CIMS project. Is this billed to BOEM, or is their and award letter that we have accept, get through the Somerville process, pay and seek reimbursement from Boston ?

Thank you.

Are you sure that this is 2015? I found an award letter for \$4,560.09 for UASI 2014. Can you send me a copy of the invoice from Lan-tel?

For FFYI 2015 for Somerville I have the assembly square project, which falls under U15-2.2 CIMS. This should be billed directly to OEM. And the Somerville City Hall project for \$29, 685.60 which is what the award letter I sent you is for and which should be billed directly to Somerville and reimbursed by OEM to your department (or whatever department contracts and expends the work). I don't have anything else, so I am hoping that it was work done as part of the scope I just sent to Eric for confirmation.

Subject: Manager of Marketing and Corporate Communications Position

Hi Everyone,

We are posting the attached job opening on our website and LinkedIn this afternoon. Please post it to your Linked In contacts, colleagues, etc.

Let me know if you have any questions.

Thanks,

Kate

Position: Manager of Marketing and Corporate Communications

Job Description:

This position will manage all of LAN-TEL's marketing and corporate communications initiatives; the website, social media, email campaigns, content development, public relations, customer events, and trade shows. This role will also involve the support of the sales and business development teams in sales operations, interacting with customers, and closing business.

General Responsibilities:

- Develop and launch marketing campaigns and measure ROI
- Continually update website and monitor analytics for use in future marketing initiatives
- Manage and track activity of the company's social media sites
- Ensure Search Engine Optimization
- Analyze marketing and sales data and develop recommendations for sales and business development teams
- Create marketing collateral, brochures, advertising, and public relations pieces
- Collaborate with sales and business development to continually grow and update the marketing contact database and email list
- Coordinate all customer marketing events, trade shows, and seminars
- Build relationships with media outlets and journalists to facilitate placement and advertising of company information and events
- Assist sales teams in developing winning proposals and following up on customer leads

Desired Qualifications:

- BA/BS or equivalent experience of at least 3-5 years in a marketing/corporate communications role
- Proficiency in using and managing social media in a business environment
- Experience in creating marketing collateral and crafting content for the web
- Expert writing and grammar skills
- Ability to communicate effectively with customers both in person and via written communications
- Knowledge of Search Engine Optimization techniques, analytics software, and key word tools
- Fluency in MS Office Applications, Adobe Creative Suite and Word Press
- Knowledge of Salesforce.com

Pay and Benefits:

In addition to a competitive base salary, LAN-TEL offers an extremely generous compensation package that includes the following:

- Medical, Dental and Vision Insurance
- Short and Long-Term Disability Plans
- Life Insurance
- 401K Plan with Company Matching
- Profit Sharing
- Paid Vacation and Holidays

Please send resume to:

Hi Kate,

The payments that I have applied to the \$700,00 PO total \$187,202 leaving a remaining balance of \$512,798. Does that sound correct to you? this does not include any activity for July, which we have not been invoiced for yet.

Hope you are both well,

Hi Kate,

The payments that I have applied to the \$700,00 PO total \$187,202 leaving a remaining balance of \$512,798. Does that sound correct to you? this does not include any activity for July, which we have not been invoiced for yet.

Hope you are both well,

Thanks Eric. As to question 1, do you have the name/model/serial # of the broken camera? Or would that be in the OEM file?

Question 1
Everett chestnut 1 MAC 00-07-54-72-84-8A

Everett chestnut 2 MAC 00-07-5F -72-2C -1C
Both are Bosch Gen 4 autodomes
[image2.JPG]
[image1.JPG]

Question 2 and 4

The original quick deploy camera was installed on approximately 6/16/ 2015

It was reported that the camera could not move on 8/17/ 2015 and we repaired .

It was then reported that it was not working on 9/21/2015 we then replaced with with the 2 cameras shown above after this date .

On 2/16 /2016 it was reported that both cameras were down and we repaired

On 4/25/2016 it was reported that they were down and we repaired .

The maintenance records are given to Boston OEM (office of emergency management) and they are the record keeper and owner of any transactions for these cameras . I could not give any official records without consent .

Question 3
Lan Tel Communications of Norwood and is the listed vendor that maintains these specific cameras and associated

equipment .

Question 5

See Question 3

Question 8

I do not understand question and more specifically the word "forms" I would be guessing to what they are alluding too for an concise answer.

Respectfully ,

Eric Johnson

Hi Nicole,

Question # 6 is very generic and hard to answer without additional information. Only images that have been requested are captured and preserved. The system overwrites itself every 30 days. I can produce requested footage if I have the case numbers.

Question # 7 The computers that record the footage and the actual DVD's that have been requested are stored at the police station.

Question # 9 I am the one that preserves the footage after Captain Dunn approves the request. The DVD's are then put into evidence by Detective Coen

Please give me a call if you need additional information. Pam

Hi Pam, thanks so much, I've been in touch with Eric and he is working to get me what he can on his end. He said that items 6, 7, and 9 would be in the purview of the Chelsea PD - - would you be able to assist with those please? As to item 6 - was the camera broken for the range of dates from which he requests images? If not, do any of those images still exist? If they do, please let me know and we can discuss further. If they don't, that answer is simple.

Thanks again,

Nicole

Hello,

I'm just checking in to make sure this hasn't fallen off the radar - - we have a court date next Friday 7/29 to provide what the Chelsea PD / Lan-Tel is willing to turn over; any additional existing material will surely be the subject of a motion to compel production. If you have objections to it, please let me know and I'll work with your legal department.

Thanks again for your attention to this matter,

Nicole

Subject: RE: Everett Ave

Hi Pam and Jason,

I hope all is well. In addition to the letter explaining the functionality of the cameras in question on 1/1/16, I must produce the items requested in the attached motion, to the extent they are in the custody of the Chelsea PD. If the information is in the custody of a 3rd party (Lan-Tel?), the defense will file a motion seeking them to produce it. If possible, coordination with Lan-Tel to produce the requested information would be best. If Chelsea PD or Lan-Tel has any questions, concerns, or objections about production of any of these items, please let me know. The compliance date is 7/29/16.

Please feel free to call me at 617-619-4130 if you'd like to discuss any of this.

Thanks so much for your time and attention to this matter, and have a safe 4th.

Nicole

Hi Eric,

The Defense Attorney for a case took this photo of Everett Ave and Chestnut. He has already received the DVDS from the 2 cameras that work. He wants us to preserve evidence from the 3rd camera. If I am not mistaken, the 3rd camera was the Quick Deploy that doesn't work. Am I correct? Which camera doesn't work? Can you write something on your letterhead explaining about the third camera, so the detective can take it to court. Thanks/Pam

Subject: IV&C "Quick Deploy" Cameras

Hi Eric and Pam,

It has come to my attention that one of the mobile cameras that OEM purchased for Chelsea in June of 2014 was disposed of without my knowledge. I need to determine which of the two cameras this was. OEM is required to report the dispossession of Homeland Security purchased equipment to the state on an annual basis.

I may be able to determine through process of elimination which camera this was if Chelsea or Lan-tel Communications can provide the serial number of the camera that is still in circulation.

Please let me know if you have any questions.

Subject: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed
Attachment(s): "smime.p7s"

Folks,

I'm just noting that the BridgeWave 80G radio at 35 Northampton that shoots to Schroeder Plaza failed today at about 12:20. It might have lost power, or it could be failure of the actual unit, but the confirmed problem is that both network connections (one fiber, the other copper) are currently showing as down.

This is not unexpected, as this radio has been too flaky to use for the past few months. I've had the routing metrics set high enough that traffic would only flow over this link if we lost all other connectivity to 35 Northampton.

While we haven't been using this microwave link for a while, it is still an important direct connection between two strategically vital sites. The 35 Northampton site handles a substantial number of CIMS cameras from multiple feeder sites, and provides backbone microwave links to Quincy HS, the JFK Building, and Egleston Tower (Walnut Park). We also maintain a link to the Office of the Chief Medical Examiner (OCME) from 35 Northampton, and we have a backup path to the Transit Police via microwave.

My recommendation would be to replace this microwave link with something that would be reliable. It does not need to be a Gbps link like the BridgeWave, but we do need at least 200 Mbps to handle the CIMS traffic, and >400 Mbps would be desirable.

There is a BoNet connection to 35 Northampton, but we have lost this BoNet connection several times in the past, and when we did, we relied on the BridgeWave link to keep things working. Also, PSnet has only a single connection into BoNet at Schroeder Plaza, so having a second path to the PSnet backbone via 35 Northampton helps maintain connectivity to Schroeder Plaza.

My thoughts ;

Chuck , you mention Bo Net fiber is located at that location, and that connection has been lost in the past, would it make sense to see if Bo Net can repair the fiber path, until a new microwave can be installed?
Could we also get a ball price on what the new hardware & installation would cost?

Eric,
Are cameras down because of this? or are they running on an alternate path?

Eamon - could we see if we have funding available - maybe from Cisms , since this seems to be a main camera hub, to get this replaced ?

Thanks,
Scott

Subject: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed
Importance: High

Folks,

I'm just noting that the BridgeWave 80G radio at 35 Northampton that shoots to Schroeder Plaza failed today at about 12:20. It might have lost power, or it could be failure of the actual unit, but the confirmed problem is that both network connections (one fiber, the other copper) are currently showing as down.

This is not unexpected, as this radio has been too flaky to use for the past few months. I've had the routing metrics set high enough that traffic would only flow over this link if we lost all other connectivity to 35 Northampton.

While we haven't been using this microwave link for a while, it is still an important direct connection between two strategically vital sites. The 35 Northampton site handles a substantial number of CIMS cameras from multiple feeder sites, and provides backbone microwave links to Quincy HS, the JFK Building, and Egleston Tower (Walnut Park). We also maintain a link to the Office of the Chief Medical Examiner (OCME) from 35 Northampton, and we have a backup path to the Transit Police via microwave.

My recommendation would be to replace this microwave link with something that would be reliable. It does not need to be a Gbps link like the BridgeWave, but we do need at least 200 Mbps to handle the CIMS traffic, and >400 Mbps would be desirable.

There is a BoNet connection to 35 Northampton, but we have lost this BoNet connection several times in the past, and when we did, we relied on the BridgeWave link to keep things working. Also, PSnet has only a single connection into BoNet at Schroeder Plaza, so having a second path to the PSnet backbone via 35 Northampton helps maintain connectivity to Schroeder Plaza.

We would need some idea of cost to see if we can pull from either PsNet and/or CIMS funding. If we are considering asking BoNet to repair the fiber path, do we want to pull in Dan Rothman?

Subject: Re: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed

Attachment(s): "smime.p7s"

Scott,

To be clear, the BoNet fiber connection to 35 Northampton is working fine. I was just noting that having an alternative microwave path to this site has been useful in the past when we've had either fiber problems or BoNet issues with PSnet connectivity to 35 Northampton. I was also noting that having a direct connection out of Schroeder Plaza into a major PSnet backbone site is useful for backing up the one connection that PSnet has into BoNet at Schroeder Plaza.

Overall, the importance of this link is that it provides a strategically significant backup path between Schroeder Plaza and 35 Northampton. Having a working microwave path would substantially enhance resilience for the entire MBHSR region.

Fred and I have discussed multiple options we could use for replacing this microwave link. The link distance is only 1.29 km (4,248 ft), so this is not a difficult microwave shot. In summary, our options are:

1. Repair the existing 80 GHz BridgeWave radios.
 - This presumes the manufacturer would agree to repair them.
 - Note, we might find that the problem that caused the 35 Northampton radio to fail could be as simple as a dead power supply, but the problems with this pair of radios run much deeper than just a bad power supply.
 - We would need to get a quote from the manufacturer before I can offer an estimate of repair cost. My ball park estimate (i.e., guess) would be around \$2k, or \$1k per radio. It could be much more.
2. Replace the BridgeWave radios with new 80 GHz radios from BridgeWave or a competitor.
 - The problem with this approach is that our experience has been that the 80 GHz band suffers from too much rain fade, so this will continue to be a problem if we stick with this band.
 - The primary advantage of staying with the 80 GHz band is that we could continue to use the regional FCC license for this band.
 - If we stuck with BridgeWave, a new replacement pair appears to cost about \$15k, but there would likely be some add-ons we might need or want to acquire. The total capital costs could easily approach \$20k. (Aside, the original cost for this pair of radios was in excess of \$30k)
 - Other manufacturers might be much less expensive, perhaps closer to \$10k per pair. This would require further research.
 - Given our experiences with the 80 GHz band, and the apparent cost, this is not a recommended approach.
3. Replace the BridgeWave radios with 23 GHz radios
 - Given the relatively short distance of this link, the 23 GHz band should perform well in all but the most intensive rain showers. Barring hurricanes, we might see 2 to 3 brief outages per year due to rain fade.
 - We would require a new FCC license for this link. Estimated licensing costs would be around \$2k.
 - DragonWave is our current vendor for radios operating in this band. A pair of new radios would cost about \$13k, but we would need to include another \$2k - 4k for software keys to enable speeds above 10 Mbps. These radios can now support 1 Gbps, but at the cost of upgrade keys.
 - An alternative manufacturer is SAF, who has gained a very solid reputation. A pair of 23 GHz "Integra" radios with integrated 2' (60 cm) antennas would cost around \$10k. However, SAF does not play any games with upgrade keys to enable higher speeds. Maximum speed is currently 1 Gbps, but we might choose to operate at a lower bit rate.
4. Replace the BridgeWave radios with 18 GHz radios
 - This might improve rain fade immunity, but for this short distance, the difference relative to 23 GHz is probably not significant.
 - The licensing issues would be similar to 23 GHz. One reason for considering the 18 GHz option would be if we run into too many conflicts with other 23 GHz users in the area.
 - Costs for DragonWave and SAF models would be similar to the 23 GHz option.

In addition to capital equipment costs, there would be labor costs associated with upgrading this link. At a bare minimum, there is the necessary expense of taking down the BridgeWave radios. There would also be the cost of installing new radios at both sites, though we would be able to leverage existing cabling. However, at 35 Northampton, we would need to install a new mount (or reuse the unused GigaBeam mount). Finally, there would be labor associated with configuring and integrating new radios into PSnet, and providing management. Our recommendation would be to use LAN-TEL for the physical installation work, as they are quite familiar with both sites. The physical installation for both sites could be done in one day by two experienced installers, including alignment. The configuration and integration labor should cost about \$1.6k. The *caveat* is that this presumes no significant problems are encountered with either the installation or configuration/integration work.

Our current recommendation would be to deploy SAF 23 GHz Integra radios to replace the BridgeWave link. This is a reasonable cost that we believe is justifiable in terms of improved network resilience. The improvements would benefit the region as a whole, as well as

the CIMS and radio system applications.

Fred and I will be happy to address further questions or provide more detail if requested.

Subject: Fwd: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed

Attachment(s): "smime.p7s"

PSNEC Members,

See the email from Chuck below. The BridgeWave 80 GHz radio at 35 Northampton has failed. Scott and I have already spoken but we need some more information. Chuck has given multiple options to resolve the issue, all of which are pretty expensive. We are trying to get a bit more information on whether this site has mainly just camera traffic or not, so Scott is reaching out to Eric Johnson. I've also added Chief Reardon to weigh in on whether there is radio traffic running through the link or not.

I'm emailing for any input from anyone on the committee on what we should do. Chuck has recommended option 3 on his list SAF 23GHz radios (see below). Since we do not have a change management system in place yet, we'll use this email chain to gather your opinions the subject matter experts and make a decision.

Radio folks- Do you know what the turnaround time would be to get a new FCC license for the link? I know they are all currently held by Boston. The time frame definitely will have an impact on our decision based on what funding is available.

As always, thank you for your time and input.

Eamon

Subject: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed
Importance: High

Folks,

I'm just noting that the BridgeWave 80G radio at 35 Northampton that shoots to Schroeder Plaza failed today at about 12:20. It might have lost power, or it could be failure of the actual unit, but the confirmed problem is that both network connections (one fiber, the other copper) are currently showing as down.

This is not unexpected, as this radio has been too flaky to use for the past few months. I've had the routing metrics set high enough that traffic would only flow over this link if we lost all other connectivity to 35 Northampton.

While we haven't been using this microwave link for a while, it is still an important direct connection between two strategically vital sites. The 35 Northampton site handles a substantial number of CIMS cameras from multiple feeder sites, and provides backbone microwave links to Quincy HS, the JFK Building, and Egleston Tower (Walnut Park). We also maintain a link to the Office of the Chief Medical Examiner (OCME) from 35 Northampton, and we have a backup path to the Transit Police via microwave.

My recommendation would be to replace this microwave link with something that would be reliable. It does not need to be a Gbps link like the BridgeWave, but we do need at least 200 Mbps to handle the CIMS traffic, and >400 Mbps would be desirable.

There is a BoNet connection to 35 Northampton, but we have lost this BoNet connection several times in the past, and when we did, we relied on the BridgeWave link to keep things working. Also, PSnet has only a single connection into BoNet at Schroeder Plaza, so having a second path to the PSnet backbone via 35 Northampton helps maintain connectivity to Schroeder Plaza.

...Chuck

Subject: Fwd: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed

PSNEC Members,

See the email from Chuck below. The BridgeWave 80 GHz radio at 35 Northampton has failed. Scott and I have already spoken but we need some more information. Chuck has given multiple options to resolve the issue, all of which are pretty expensive. We are trying to get a bit more information on whether this site has mainly just camera traffic or not, so Scott is reaching out to Eric Johnson. I've also added Chief Reardon to weigh in on whether there is radio traffic running through the link or not.

I'm emailing for any input from anyone on the committee on what we should do. Chuck has recommended option 3 on his list SAF 23GHz radios (see below) . Since we do not have a change management system in place yet, we'll use this email chain to gather your opinions the subject matter experts and make a decision.

Radio folks- Do you know what the turnaround time would be to get a new FCC license for the link? I know they are all currently held by Boston. The time frame definitely will have an impact on our decision based on what funding is available.

As always, thank you for your time and input.

Eamon

Cc: Eric Johnson <EJohnson@lan-tel.com>, Glenn Turner <GTurner@cambridgefire.org>, Fred Goldstein <Fred@interisle.net>, Colin Strutt <Colin@interisle.net>

Scott,

To be clear, the BoNet fiber connection to 35 Northampton is working fine. I was just noting that having an alternative microwave path to this site has been useful in the past when we've had either fiber problems or BoNet issues with PSnet connectivity to 35 Northampton. I was also noting that having a direct connection out of Schroeder Plaza into a major PSnet backbone site is useful for backing up the one connection that PSnet has into BoNet at Schroeder Plaza.

Overall, the importance of this link is that it provides a strategically significant backup path between Schroeder Plaza and 35 Northampton. Having a working microwave path would substantially enhance resilience for the entire MBHSR region.

Fred and I have discussed multiple options we could use for replacing this microwave link. The link distance is only 1.29 km (4,248 ft), so this is not a difficult microwave shot. In summary, our options are:

1. Repair the existing 80 GHz BridgeWave radios.
 - This presumes the manufacturer would agree to repair them.
 - Note, we might find that the problem that caused the 35 Northampton radio to fail could be as simple as a dead power supply, but the problems with this pair of radios run much deeper than just a bad power supply.
 - We would need to get a quote from the manufacturer before I can offer an estimate of repair cost. My ball park estimate (i.e., guess) would be around \$2k, or \$1k per radio. It could be much more.
2. Replace the BridgeWave radios with new 80 GHz radios from BridgeWave or a competitor.
 - The problem with this approach is that our experience has been that the 80 GHz band suffers from too much rain fade, so this will continue to be a problem if we stick with this band.
 - The primary advantage of staying with the 80 GHz band is that we could continue to use the regional FCC license for this band.
 - If we stuck with BridgeWave, a new replacement pair appears to cost about \$15k, but there would likely be some add-ons we might need or want to acquire. The total capital costs could easily approach \$20k. (Aside, the original cost for this pair of radios was in excess of \$30k)
 - Other manufacturers might be much less expensive, perhaps closer to \$10k per pair. This would require further research.
 - Given our experiences with the 80 GHz band, and the apparent cost, this is not a recommended approach.
3. Replace the BridgeWave radios with 23 GHz radios
 - Given the relatively short distance of this link, the 23 GHz band should perform well in all but the most intensive rain showers. Barring hurricanes, we might see 2 to 3 brief outages per year due to rain fade.
 - We would require a new FCC license for this link. Estimated licensing costs would be around \$2k.
 - DragonWave is our current vendor for radios operating in this band. A pair of new radios would cost about \$13k, but we would need to include another \$2k - 4k for software keys to enable speeds above 10 Mbps. These radios can now support 1 Gbps, but at the cost of upgrade keys.
 - An alternative manufacturer is SAF, who has gained a very solid reputation. A pair of 23 GHz "Integra" radios with integrated 2' (60 cm) antennas would cost around \$10k. However, SAF does not play any games with upgrade keys to enable higher speeds. Maximum speed is currently 1 Gbps, but we might choose to operate at a lower bit rate.
4. Replace the BridgeWave radios with 18 GHz radios
 - This might improve rain fade immunity, but for this short distance, the difference relative to 23 GHz is probably not significant.
 - The licensing issues would be similar to 23 GHz. One reason for considering the 18 GHz option would be if we run into too many conflicts with other 23 GHz users in the area.
 - Costs for DragonWave and SAF models would be similar to the 23 GHz option.

In addition to capital equipment costs, there would be labor costs associated with upgrading this link. At a bare minimum, there is the necessary expense of taking down the BridgeWave radios. There would also be the cost of installing new radios at both sites, though we would be able to leverage existing cabling. However, at 35 Northampton, we would need to install a new mount (or reuse the unused GigaBeam mount). Finally, there would be labor associated with configuring and integrating new radios into PSnet, and providing management. Our recommendation would be to use LAN-TEL for the physical installation work, as they are quite familiar with both sites. The physical installation for both sites could be done in one day by two experienced installers, including alignment. The configuration and integration labor should cost about \$1.6k. The *caveat* is that this presumes no significant problems are encountered with either the installation or configuration/integration work.

Our current recommendation would be to deploy SAF 23 GHz Integra radios to replace the BridgeWave link. This is a reasonable cost that we believe is justifiable in terms of improved network resilience. The improvements would benefit the region as a whole, as well as the CIMS and radio system applications.

Fred and I will be happy to address further questions or provide more detail if requested.

Subject: RE: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed

Good Evening,

Bonet is at BPD HQ.

Bonet is at 35 Northampton Street.

DoIT is making big strides in keeping Bonet operating at a level that support public safety needs.

In my opinion this link should not be replaced as we look to removing microwave links across Boston and utilizing in place Bonet to perform this backhaul, especially where this link is connecting locations that are served by Bonet.

This is a lot of money for a new microwave shot (that should go, to link to jurisdiction that needs it) and time (min 30 days) to license this new microwave.

Thank you,

-John

Subject: Fwd: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed

PSNEC Members,

See the email from Chuck below. The BridgeWave 80 GHz radio at 35 Northampton has failed. Scott and I have already spoken but we need some more information. Chuck has given multiple options to resolve the issue, all of which are pretty expensive. We are trying to get a bit more information on whether this site has mainly just camera traffic or not, so Scott is reaching out to Eric Johnson. I've also added Chief Reardon to weigh in on whether there is radio traffic running through the link or not.

I'm emailing for any input from anyone on the committee on what we should do. Chuck has recommended option 3 on his list SAF 23GHz radios (see below) . Since we do not have a change management system in place yet, we'll use this email chain to gather your opinions the subject matter experts and make a decision.

Radio folks- Do you know what the turnaround time would be to get a new FCC license for the link? I know they are all currently held by Boston. The time frame definitely will have an impact on our decision based on what funding is available.

As always, thank you for your time and input.

Eamon

Scott,

To be clear, the BoNet fiber connection to 35 Northampton is working fine. I was just noting that having an alternative microwave path to this site has been useful in the past when we've had either fiber problems or BoNet issues with PSnet connectivity to 35 Northampton. I was also noting that having a direct connection out of Schroeder Plaza into a major PSnet backbone site is useful for backing up the one connection that PSnet has into BoNet at Schroeder Plaza.

Overall, the importance of this link is that it provides a strategically significant backup path between Schroeder Plaza and 35 Northampton. Having a working microwave path would substantially enhance resilience for the entire MBHSR region.

Fred and I have discussed multiple options we could use for replacing this microwave link. The link distance is only 1.29 km (4,248 ft), so this is not a difficult microwave shot. In summary, our options are:

1. Repair the existing 80 GHz BridgeWave radios.
 - This presumes the manufacturer would agree to repair them.
 - Note, we might find that the problem that caused the 35 Northampton radio to fail could be as simple as a dead power supply, but the problems with this pair of radios run much deeper than just a bad power supply.
 - We would need to get a quote from the manufacturer before I can offer an estimate of repair cost. My ball park estimate (i.e., guess) would be around \$2k, or \$1k per radio. It could be much more.
2. Replace the BridgeWave radios with new 80 GHz radios from BridgeWave or a competitor.
 - The problem with this approach is that our experience has been that the 80 GHz band suffers from too much rain fade, so this will continue to be a problem if we stick with this band.
 - The primary advantage of staying with the 80 GHz band is that we could continue to use the regional FCC license for this band.
 - If we stuck with BridgeWave, a new replacement pair appears to cost about \$15k, but there would likely be some add-ons we might need or want to acquire. The total capital costs could easily approach \$20k. (Aside, the original cost for this pair of radios was in excess of \$30k)
 - Other manufacturers might be much less expensive, perhaps closer to \$10k per pair. This would require further research.
 - Given our experiences with the 80 GHz band, and the apparent cost, this is not a recommended approach.
3. Replace the BridgeWave radios with 23 GHz radios
 - Given the relatively short distance of this link, the 23 GHz band should perform well in all but the most intensive rain showers. Barring hurricanes, we might see 2 to 3 brief outages per year due to rain fade.
 - We would require a new FCC license for this link. Estimated licensing costs would be around \$2k.
 - DragonWave is our current vendor for radios operating in this band. A pair of new radios would cost about \$13k, but we would need to include another \$2k - 4k for software keys to enable speeds above 10 Mbps. These radios can now support 1 Gbps, but at the cost of upgrade keys.
 - An alternative manufacturer is SAF, who has gained a very solid reputation. A pair of 23 GHz "Integra" radios with integrated 2' (60 cm) antennas would cost around \$10k. However, SAF does not play any games with upgrade keys to enable higher speeds. Maximum speed is currently 1 Gbps, but we might choose to operate at a lower bit rate.
4. Replace the BridgeWave radios with 18 GHz radios
 - This might improve rain fade immunity, but for this short distance, the difference relative to 23 GHz is probably not significant.
 - The licensing issues would be similar to 23 GHz. One reason for considering the 18 GHz option would be if we run into too many conflicts with other 23 GHz users in the area.
 - Costs for DragonWave and SAF models would be similar to the 23 GHz option.

In addition to capital equipment costs, there would be labor costs associated with upgrading this link. At a bare minimum, there is the necessary expense of taking down the BridgeWave radios. There would also be the cost of installing new radios at both sites, though we would be able to leverage existing cabling. However, at 35 Northampton, we would need to install a new mount (or reuse the unused GigaBeam mount). Finally, there would be labor associated with configuring and integrating new radios into PSnet, and providing management. Our recommendation would be to use LAN-TEL for the physical installation work, as they are quite familiar with both sites. The physical installation for both sites could be done in one day by two experienced installers, including alignment. The configuration and integration labor should cost about \$1.6k. The *caveat* is that this presumes no significant problems are encountered with either the installation or configuration/integration work.

Our current recommendation would be to deploy SAF 23 GHz Integra radios to replace the BridgeWave link. This is a reasonable cost that we believe is justifiable in terms of improved network resilience. The improvements would benefit the region as a whole, as well as the CIMS and radio system applications.

Fred and I will be happy to address further questions or provide more detail if requested.

Subject: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed
Importance: High

Folks,

I'm just noting that the BridgeWave 80G radio at 35 Northampton that shoots to Schroeder Plaza failed today at about 12:20. It might have lost power, or it could be failure of the actual unit, but the confirmed problem is that both network connections (one fiber, the other copper) are currently showing as down.

This is not unexpected, as this radio has been too flaky to use for the past few months. I've had the routing metrics set high enough that traffic would only flow over this link if we lost all other connectivity to 35 Northampton.

While we haven't been using this microwave link for a while, it is still an important direct connection between two strategically vital sites. The 35 Northampton site handles a substantial number of CIMS cameras from multiple feeder sites, and provides backbone microwave links to Quincy HS, the JFK Building, and Egleston Tower (Walnut Park). We also maintain a link to the Office of the Chief Medical Examiner (OCME) from 35 Northampton, and we have a backup path to the Transit Police via microwave.

My recommendation would be to replace this microwave link with something that would be reliable. It does not need to be a Gbps link like the BridgeWave, but we do need at least 200 Mbps to handle the CIMS traffic, and >400 Mbps would be desirable.

There is a BoNet connection to 35 Northampton, but we have lost this BoNet connection several times in the past, and when we did, we relied on the BridgeWave link to keep things working. Also, PSnet has only a single connection into BoNet at Schroeder Plaza, so having a second path to the PSnet backbone via 35 Northampton helps maintain connectivity to Schroeder Plaza.

Subject: Re: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed

Hi All,

I guess the big question I would ask is if this is a critical site according to our group?

Do we want all critical locations to have at least two methods of connecting?

Do we want diverse links? Shouldn't we avoid putting all of our eggs in one basket (all microwave or all BoNet)?

If the standard for critical link locations is to have separate diverse links, we should have a BoNet connection and a microwave connection.

If we deem this location not critical, then don't put the money into the microwave.

Can BoNet provide true redundant links to this site?

Just my two cents. Sorry for the delay in my response.

The only question I might entertain concerns one of Chuck's comments in the 4th option (2nd bullet): "One reason for considering the 18 GHz option would be if we run into too many conflicts with other 23 GHz users in the area. Define "too many conflicts" - how many other 23 GHz users are there in that area and what is the probability of "too many conflicts?"

Good afternoon all,

Sorry for the delayed response.

I think this project should be wait listed unless the site is clearly identified as a critical site (as Glenn indicated).

By critical I mean that if this site loses connectivity for more than a few minutes that there would be regional wide-area, multisystem failures. If loss of this site mean we lose a few cameras until BoNet is back online, I think that \$10k-\$30k could be better prioritized.

My understanding of PSnet is that it is a self-healing, diverse route network, so I don't see why we would lose anything other than the appliances that are locally terminated at this node. (I may be completely wrong)

I feel we could spend \$30k replacing a link to a node with no redundant path that is in the same condition as the 80Ghz Bridgewave that has failed.

Subject: Fwd: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed

PSNEC Members,

See the email from Chuck below. The BridgeWave 80 GHz radio at 35 Northampton has failed. Scott and I have already spoken but we need some more information. Chuck has given multiple options to resolve the issue, all of which are pretty expensive. We are trying to get a bit more information on whether this site has mainly just camera traffic or not, so Scott is reaching out to Eric Johnson. I've also added Chief Reardon to weigh in on whether there is radio traffic running through the link or not.

I'm emailing for any input from anyone on the committee on what we should do. Chuck has recommended option 3 on his list SAF 23GHz radios (see below) . Since we do not have a change management system in place yet, we'll use this email chain to gather your opinions the subject matter experts and make a decision.

Radio folks- Do you know what the turnaround time would be to get a new FCC license for the link? I know they are all currently held by Boston. The time frame definitely will have an impact on our decision based on what funding is available.

As always, thank you for your time and input.

Eamon

Scott,

To be clear, the BoNet fiber connection to 35 Northampton is working fine. I was just noting that having an alternative microwave path to this site has been useful in the past when we've had either fiber problems or BoNet issues with PSnet connectivity to 35 Northampton. I was also noting that having a direct connection out of Schroeder Plaza into a major PSnet backbone site is useful for backing up the one connection that PSnet has into BoNet at Schroeder Plaza.

Overall, the importance of this link is that it provides a strategically significant backup path between Schroeder Plaza and 35 Northampton. Having a working microwave path would substantially enhance resilience for the entire MBHSR region.

Fred and I have discussed multiple options we could use for replacing this microwave link. The link distance is only 1.29 km (4,248 ft), so this is not a difficult microwave shot. In summary, our options are:

1. Repair the existing 80 GHz BridgeWave radios.
 - This presumes the manufacturer would agree to repair them.
 - Note, we might find that the problem that caused the 35 Northampton radio to fail could be as simple as a dead power supply, but the problems with this pair of radios run much deeper than just a bad power supply.
 - We would need to get a quote from the manufacturer before I can offer an estimate of repair cost. My ball park estimate (i.e., guess) would be around \$2k, or \$1k per radio. It could be much more.
2. Replace the BridgeWave radios with new 80 GHz radios from BridgeWave or a competitor.
 - The problem with this approach is that our experience has been that the 80 GHz band suffers from too much rain fade, so this will continue to be a problem if we stick with this band.
 - The primary advantage of staying with the 80 GHz band is that we could continue to use the regional FCC license for this band.
 - If we stuck with BridgeWave, a new replacement pair appears to cost about \$15k, but there would likely be some add-ons we might need or want to acquire. The total capital costs could easily approach \$20k. (Aside, the original cost for this pair of radios was in excess of \$30k)
 - Other manufacturers might be much less expensive, perhaps closer to \$10k per pair. This would require further research.
 - Given our experiences with the 80 GHz band, and the apparent cost, this is not a recommended approach.
3. Replace the BridgeWave radios with 23 GHz radios
 - Given the relatively short distance of this link, the 23 GHz band should perform well in all but the most intensive rain showers. Barring hurricanes, we might see 2 to 3 brief outages per year due to rain fade.
 - We would require a new FCC license for this link. Estimated licensing costs would be around \$2k.
 - DragonWave is our current vendor for radios operating in this band. A pair of new radios would cost about \$13k, but we would need to include another \$2k - 4k for software keys to enable speeds above 10 Mbps. These radios can now support 1 Gbps, but at the cost of upgrade keys.
 - An alternative manufacturer is SAF, who has gained a very solid reputation. A pair of 23 GHz "Integra" radios with integrated 2' (60 cm) antennas would cost around \$10k. However, SAF does not play any games with upgrade keys to enable higher speeds. Maximum speed is currently 1 Gbps, but we might choose to operate at a lower bit rate.
4. Replace the BridgeWave radios with 18 GHz radios
 - This might improve rain fade immunity, but for this short distance, the difference relative to 23 GHz is probably not significant.
 - The licensing issues would be similar to 23 GHz. One reason for considering the 18 GHz option would be if we run into too many conflicts with other 23 GHz users in the area.
 - Costs for DragonWave and SAF models would be similar to the 23 GHz option.

In addition to capital equipment costs, there would be labor costs associated with upgrading this link. At a bare minimum, there is the necessary expense of taking down the BridgeWave radios. There would also be the cost of installing new radios at both sites, though we would be able to leverage existing cabling. However, at 35 Northampton, we would need to install a new mount (or reuse the unused GigaBeam mount). Finally, there would be labor associated with configuring and integrating new radios into PSnet, and providing management. Our recommendation would be to use LAN-TEL for the physical installation work, as they are quite familiar with both sites. The physical installation for both sites could be done in one day by two experienced installers, including alignment. The

configuration and integration labor should cost about \$1.6k. The *caveat* is that this presumes no significant problems are encountered with either the installation or configuration/integration work.

Our current recommendation would be to deploy SAF 23 GHz Integra radios to replace the BridgeWave link. This is a reasonable cost that we believe is justifiable in terms of improved network resilience. The improvements would benefit the region as a whole, as well as the CIMS and radio system applications.

Fred and I will be happy to address further questions or provide more detail if requested.

Subject: PSnet: BridgeWave 80GHz radio at 35 Northampton has failed
Importance: High

Folks,

I'm just noting that the BridgeWave 80G radio at 35 Northampton that shoots to Schroeder Plaza failed today at about 12:20. It might have lost power, or it could be failure of the actual unit, but the confirmed problem is that both network connections (one fiber, the other copper) are currently showing as down.

This is not unexpected, as this radio has been too flaky to use for the past few months. I've had the routing metrics set high enough that traffic would only flow over this link if we lost all other connectivity to 35 Northampton.

While we haven't been using this microwave link for a while, it is still an important direct connection between two strategically vital sites. The 35 Northampton site handles a substantial number of CIMS cameras from multiple feeder sites, and provides backbone microwave links to Quincy HS, the JFK Building, and Egleston Tower (Walnut Park). We also maintain a link to the Office of the Chief Medical Examiner (OCME) from 35 Northampton, and we have a backup path to the Transit Police via microwave.

My recommendation would be to replace this microwave link with something that would be reliable. It does not need to be a Gbps link like the BridgeWave, but we do need at least 200 Mbps to handle the CIMS traffic, and >400 Mbps would be desirable.

There is a BoNet connection to 35 Northampton, but we have lost this BoNet connection several times in the past, and when we did, we relied on the BridgeWave link to keep things working. Also, PSnet has only a single connection into BoNet at Schroeder Plaza, so having a second path to the PSnet backbone via 35 Northampton helps maintain connectivity to Schroeder Plaza.

Hi All,

I guess the big question I would ask is if this is a critical site according to our group?

Do we want all critical locations to have at least two methods of connecting?

Do we want diverse links? Shouldn't we avoid putting all of our eggs in one basket (all microwave or all BoNet)?

If the standard for critical link locations is to have separate diverse links, we should have a BoNet connection and a microwave connection.

If we deem this location not critical, then don't put the money into the microwave.

Can BoNet provide true redundant links to this site?

Just my two cents. Sorry for the delay in my response.

Scott,

To be clear, the BoNet fiber connection to 35 Northampton is working fine. I was just noting that having an alternative microwave path to this site has been useful in the past when we've had either fiber problems or BoNet issues with PSnet connectivity to 35 Northampton. I was also noting that having a direct connection out of Schroeder Plaza into a major PSnet backbone site is useful for backing up the one connection that PSnet has into BoNet at Schroeder Plaza.

Overall, the importance of this link is that it provides a strategically significant backup path between Schroeder Plaza and 35 Northampton. Having a working microwave path would substantially enhance resilience for the entire MBHSR region.

Fred and I have discussed multiple options we could use for replacing this microwave link. The link distance is only 1.29 km (4,248 ft), so this is not a difficult microwave shot. In summary, our options are:

1. Repair the existing 80 GHz BridgeWave radios.

- This presumes the manufacturer would agree to repair them.
- Note, we might find that the problem that caused the 35 Northampton radio to fail could be as simple as a

dead power supply, but the problems with this pair of radios run much deeper than just a bad power supply.

- We would need to get a quote from the manufacturer before I can offer an estimate of repair cost. My ball park estimate (i.e., guess) would be around \$2k, or \$1k per radio. It could be much more.

2. Replace the BridgeWave radios with new 80 GHz radios from BridgeWave or a competitor.

- The problem with this approach is that our experience has been that the 80 GHz band suffers from too much rain fade, so this will continue to be a problem if we stick with this band.
- The primary advantage of staying with the 80 GHz band is that we could continue to use the regional FCC license for this band.
- If we stuck with BridgeWave, a new replacement pair appears to cost about \$15k, but there would likely be some add-ons we might need or want to acquire. The total capital costs could easily approach \$20k. (Aside, the original cost for this pair of radios was in excess of \$30k)
- Other manufacturers might be much less expensive, perhaps closer to \$10k per pair. This would require further research.
- Given our experiences with the 80 GHz band, and the apparent cost, this is not a recommended approach.

3. Replace the BridgeWave radios with 23 GHz radios

- Given the relatively short distance of this link, the 23 GHz band should perform well in all but the most intensive rain showers. Barring hurricanes, we might see 2 to 3 brief outages per year due to rain fade.
- We would require a new FCC license for this link. Estimated licensing costs would be around \$2k.
- DragonWave is our current vendor for radios operating in this band. A pair of new radios would cost about \$13k, but we would need to include another \$2k - 4k for software keys to enable speeds above 10 Mbps. These radios can now support 1 Gbps, but at the cost of upgrade keys.
- An alternative manufacturer is SAF, who has gained a very solid reputation. A pair of 23 GHz "Integra" radios with integrated 2' (60 cm) antennas would cost around \$10k. However, SAF does not play any games with upgrade keys to enable higher speeds. Maximum speed is currently 1 Gbps, but we might choose to operate at a lower bit rate.

4. Replace the BridgeWave radios with 18 GHz radios

- This might improve rain fade immunity, but for this short distance, the difference relative to 23 GHz is probably not significant.
- The licensing issues would be similar to 23 GHz. One reason for considering the 18 GHz option would be if we run into too many conflicts with other 23 GHz users in the area.
- Costs for DragonWave and SAF models would be similar to the 23 GHz option.

In addition to capital equipment costs, there would be labor costs associated with upgrading this link. At a bare minimum, there is the necessary expense of taking down the BridgeWave radios. There would also be the cost of installing new radios at both sites, though we would be able to leverage existing cabling. However, at 35 Northampton, we would need to install a new mount (or reuse the unused GigaBeam mount). Finally, there would be labor associated with configuring and integrating new radios into PSnet, and providing management. Our recommendation would be to use LAN-TEL for the physical installation work, as they are quite familiar with both sites. The physical installation for both sites could be done in one day by two experienced installers, including alignment. The configuration and integration labor should cost about \$1.6k. The *caveat* is that this presumes no significant problems are encountered with either the installation or configuration/integration work.

Our current recommendation would be to deploy SAF 23 GHz Integra radios to replace the BridgeWave link. This is a reasonable cost that we believe is justifiable in terms of improved network resilience. The improvements would benefit the region as a whole, as well as the CIMS and radio system applications.

Fred and I will be happy to address further questions or provide more detail if requested.

Subject: PSnet: Connection to ShotSpotter service is down

Attachment(s): "smime.p7s"

Eric, Eric, et al.,

The Comcast Internet connection at Schroeder Plaza is barely working, and is frequently down for many minutes at a time. This problem started at 11:21 this morning. One significant consequence is that the connection to the ShotSpotter service is down, since this relies on an IPsec tunnel that goes via this Comcast connection.

I have notified Jim Fitzpatrick and Brian Barcelou of the problem. I wanted you to be aware of this issue as well, in case any of the CIMS users are affected.

Hi Pam and Eric,

I produced the information you both gave me to defense counsel, and suggested that he file a motion under rule 17 for a 3rd party (Boston OEM) to produce records. Yesterday he filed a motion for 3rd party production of records, but to all of the 3rd parties - - Boston OEM, Chelsea PD, and Lan-Tel. This requires a response directly from you all (and Boston OEM, but I contacted them separately). I've attached the relevant filings – my statement of the case, his original motion, my response, and his rule 17 motion. It is scheduled for a hearing in the 1st session of Suffolk Superior Court on October 13. Pam, I left a voicemail with the City Solicitor, but I wanted to give you a heads up too. Eric, do you have a legal department?

Sincerely,
Nicole

Subject: PSnet: Status update on JFK site
Attachment(s): "smime.p7s"

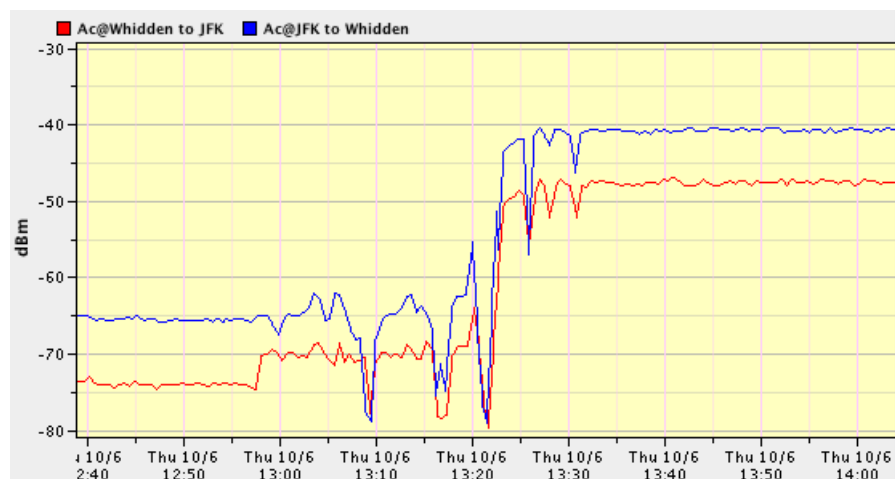

Scott, et al.,

Mark Savage, Jim Rex and I worked at the JFK site this afternoon between noon and 4:30, and we were able to resolve many of the issues with this site. In a nutshell, we set out to restore full operation to three microwave links, and we achieved this primary objective. Specifically, we...

- Aligned DragonWave AirPair 200 microwave link to Whidden Hospital achieving receive levels close to the equipment design norm. A +25 dBm improvement was achieved in signal levels. This will dramatically improve the reliability of this link and tolerance for precipitation.
- Aligned DragonWave Horizon 200 microwave link to Winthrop PD. In this case, there were problems with frozen alignment bolts and rusted mounting brackets that prevented us from meeting the expected receive levels, although the signal levels were improved considerably (+10 dBm improvement).
- Restored DragonWave AirPair 200 radio link to Broadway Tower in Revere. This radio had been rebooting every minute or so, and we confirmed our prior diagnosis that this was a flaky power supply. However, there is a secondary problem with this radio that we could not get the Ethernet connection to the radio to operate at 1 Gbps. I was able to force it to operate at 100 Mbps, so this is the current link speed (instead of the 200 Mbps rated speed). However, this is adequate for this link at this time, and way better than nothing.
- Replaced the failed Digital Loggers PDU with a new Tripp Lite PDU with ATS. This not only gives us the ability to remotely power cycle microwave radios and other equipment, it also allows us to utilize two independent power feeds, so that something like a tripped circuit breaker will not take down the site. This new PDU also has the latest firmware installed on the management card, so we can start evaluating how well the new firmware addresses the serious problems we've had with these cards.
- Cables, power supplies, and other crud left over from older camera microwave links that have been shifted to other sites was removed. This leaves us with a much less cluttered equipment rack. This also shut down some very old 5 GHz radios that were adding to the already high RF noise levels in the busy downtown area.

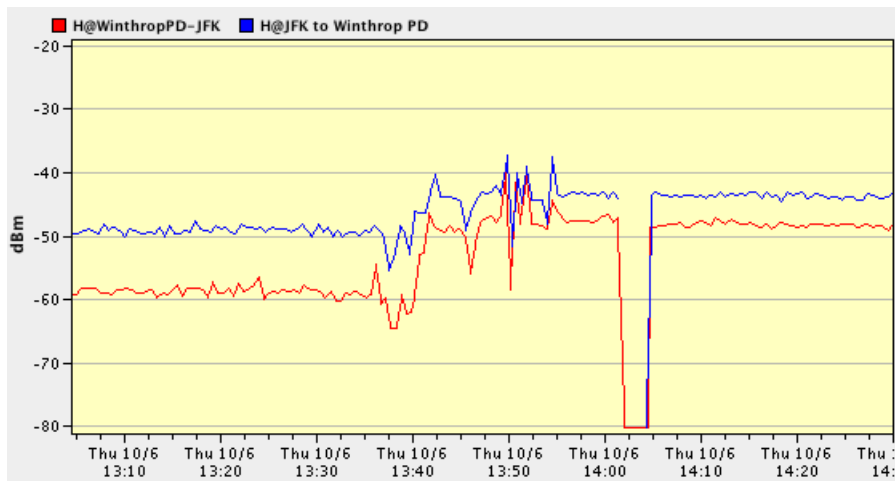

At this point, all five backbone microwave links off the JFK site are fully operational. This will significantly improve network resilience and tolerance to stormy weather conditions.

To illustrate the alignment improvements made, the following chart shows the change achieved for the JFK to Whidden link:

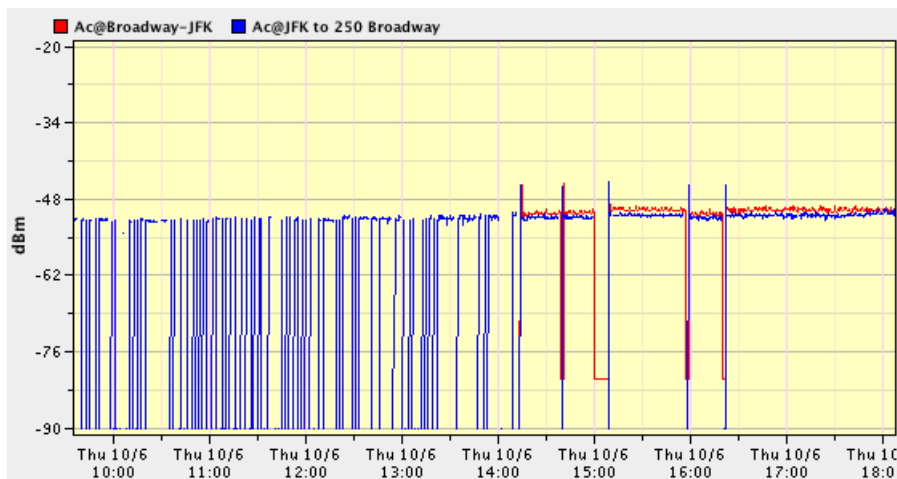

Overall, this represents a 25 dBm improvement in receive levels (since dBm is a logarithmic scale, this is a huge increase). Ideally the receive levels for both radios should be about the same, but there is a 7 dBm difference for this link. We might be able to balance this by performing another alignment at the Whidden end, but this difference could also just be due to the age of the radios themselves.

For the JFK to Winthrop link, the improvements as shown below were not as substantial:

In this case, we only achieved about a 10 dBm improvement. This is because the misalignment is in the vertical plane, and we could not free up the vertical alignment bolt. We should probably replace this radio mount so it can be aligned properly. We'll be looking into this. Jim and Mark also determined that the bolts holding the bracket for the pipe this radio is mounted on are badly rusted and loose. They were able to tighten this up a bit, but this is one of those mounting arrangements that was originally done in a substandard manner. For the record, the drop off in receive levels just after 14:00 was due to moving the power connection over to the new PDU. While not as good as we'd like, this is still much better than where we were.

Finally, here is the equivalent chart for the link from JFK to Broadway Tower:

In this chart, the time scale is longer. As can be seen, prior to 14:00, the radio was constantly rebooting, which is why the receive levels are bouncing. After we replaced the power supply, the radio link began to behave normally, and the radio is no longer rebooting. The dropouts that occurred after 14:30 were due to some rewiring we did to clean up the power connection. This link has been solid since then.

However, we also had the problem with the Ethernet data link to this radio. Several attempts to rewire the Ethernet connection at the switch end did not restore this interface, although I was able to later get it working at 100 Mbps. This could well be due to weathered cable on the roof, or a problem with the lightning arrestor.

In addition to the professional work performed by Mark and Jim, we also owe a big tip of the hat to FPS staff for allowing us to get onto this site on short notice, and for hanging around to provide an escort while we did this work. Security procedures have become noticeably more strict, and access restrictions tighter, for this facility. We were quite fortunate to get this opportunity to do this work on an emergency basis.

Attachment(s): "smime.p7s"

Chuck,

Thank you to you and the folks at Lan-Tel for the quick turnaround on the desperately needed work at JFK. I'm pleased that we have finally addressed these issues. Scott is going to follow up with Curt Wood re: a possible move to Ashburton.

I forward this note to the Executive Committee so everyone is in the loop. We look forward to hearing about the other tasks assigned to Interisle and FTG earlier this week:

- Work at the JFK Site (Completed- Thank you)
- Highest Administrative passwords to Scott (Completed Thank you)
- Full Access to FTG for network exploration and education
- EBHS Work by FTG
- Testing of new firmware at Cambridge EOC with both vendors/OEM present (please let us know when this is scheduled)
- List of UPS devices needing assistance to FTG.

I will check in next week on what progress has been made.

Committee members- If I have missed anything, please feel free to reply all.

Thanks again,
Eamon

Deirdre -

When you get back in the office can you send Gerard in purchasing the PO number for the second fire workstation. I spoke with Gerard and he expects the HIQ citywide contract to be finalized by early next week since it is under legal review.

Once that happens Gerard will try to expedite our request and get this po resolved.

Superintendent Clifford and Jason-

Hope to have this resolved by Oct.7th.

Thanks,

Mike

Hello,

I know you have been on vacation, I hope it was fun.

Can I get an update on when we should be receiving the PC for Fire Alarm?

The Fire Commissioner is inquiring and I would like to be able to give him an answer.

Than you and have a great day

Security Camera Strategy Status Meeting – 10/26/16

Time: **Wednesday, 10/26/2016, 9:00AM – 10:00AM (Back to bi-weekly schedule. Next meeting = 11/9/2016)**

Location: Conference Room 115 / Dial In: 1-866-715-6967, Passcode: 4466461 (Host: 7860059)

Called by: Linda Calnan x2875

I. Agenda-Locations / Status Updates / Action Items

Locations: (Updates in bold:)

- **Public Health – Various ongoing projects:**
 - **BPHC/EMS – On hold per BPH – Jeff to provide IP addresses for 2 admin workstations to complete set up.** Genetec training required before enabling the multiple user logins. Louie/Nelson to conduct the training.
- **L Street/Curley Ctr – BONET team completed final cleanup of network area and secured cabinets.**
Outstanding item: PO & payment for (emergency) microwave link (\$7288) – invoice provided to procurement-8/17. (Fiber connectivity to BONET - Continue to wait on contract or approval to move forward.)
- **Boston Housing Authority – Continued work by IPC on firewall policies and sharing “rules”.**
Strategy = IPsec tunnels between video VPN and BHA locations-Armory St. & HQ. (400+ cameras; BPD=view only access).
- **BRA/BTD – 12 Channel/12 Dry Dock – Security desk moving from 22 Dry Dock (to be demo’d) to 12 Channel.** Cameras to be upgraded or moved; BONET presence to be added to 12 Dry Dock.
- **City Hall – A.) New archivers for bldg. security video storage – DoIT set up 2 at 1 Summer and 2 at City Hall.** Next step = Nelson to configure. **B.) BTD system upgrade:** DoIT coordinating BTD Genetec upgrade to 5.3, after VidSys upgrade complete. Currently planning VidSys upgrade to 7.7.1 for City Hall core system for Nov-Jan timeframe.
- **Cambridge St. Guard shack – 3 new cameras being installed** for add’l views of City Hall. Mike managing.
- **Mayor’s Office Mobile Access to Video – Ongoing – Mike working with Bldg Security to discuss with Mayor’s security team on which staff needs mobile access.**
- **Canterbury Street, Public Works (Comcast) (Warehouse for city lighting-theft & security issues) – On Hold**
- Waiting on Public Works final approval of quote provided by Siemens for 16 cameras and local archiver.
- **Water & Sewer – HQ-Harrison Ave (78 cameras) & Alford St (37 cameras) - Joe Crossen working with Siemens on this.** - RFP awarded. In final stages of contract completion.
- **BFD – Headquarters and Fire alarm – Same update - mistake with PO corrected at OEM and**

Security Camera Strategy

Status Meeting – 10/26/16

workstation to be shipped - 2nd workstation being shipped.

- **Downtown Crossing –Site survey completed. To be presented to City Council ~ next month.** Louie/Shawn managing.
- **Chinatown - Site survey completed. To be presented to City Council ~ next month.** Louie/Shawn managing.
- **BPD HQ – BPD waiting for OEM to release funds.** Approved project: phase 1) cameras outside and down towards Ruggles: phase 2) cameras inside bldg. VidSys contract needs approval and PO.
- **Strand Theater- Same update** – First draft of the proposal released for internal DoIT review.
- **VidSys – A.) Upgrading City Hall core to v7.7.1 in order to upgrade Genetec systems for City Hall and BTB = Nov-Jan timeframe**
B.) Connecting State and City VidSys servers:
 - Interconnect COB & state/ MBTA systems- completed.
 - Federate the systems together, included in MOU.
- **BCYF – 112 Paris St. Fiber & Cameras – BCYF currently under construction so camera project to begin ~ 8 months. RFP has been released by BCYF.** Plan is to install pt-to-pt wireless connection and add 2 add'l cameras to suite for a total of 15 cameras. Network connectivity also required for ~45 workstations. No VoIP requirements initially – plan is to use analog until fiber is installed. Linda/Jerry working with Ken Griffin (COB PM) and BCYF team on this.
- **Fiber Maps – Linda and Dan met with Mike regarding Crown Castle fiber contract progress. Instructed to allow for more time for contract completion.** Fiber mapping continued - data for UASI region fiber; school fiber; shadow conduits; Crown Castle fiber and GlobalNaps fiber.
- **Body Cams – Pilot began 9/12.** Shawn/Louie managing. Pilot in progress.

Critical Task:

- 1.) Training for Louie to be certified with VidSys, Genetec and DVTel required – Chief Daley approved and Linda/Louie to proceed. **Training on Genetec set up for 11/15-11/16. Working on dates for Vidsys training.**

Security Camera Strategy Status Meeting – 10/26/16

II. On regular bi-weekly schedule.

Good Afternoon JPOCs,

Effective October 27, 2016, Trillium Technical LLC, formerly Atlantic Associates has elected to terminate its contract with David Menzies, the MBHSR CIS technical consultant and as of the effective date is no longer in contract with Trillium. Please cease all MBHSR/UASI related communications, access and work requests.

If you have any immediate project concerns, please let us know.

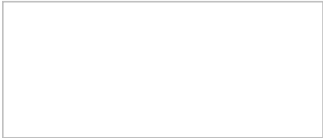

The Boston Office of Emergency Management is working to retrieve UASI-funded equipment Mr. Menzies has in his possession. If you know of any UASI-funded equipment he may have, please notify Eamon Miller at eamon.miller@boston.gov.

Regards,
Rene

Subject: MK:EOC Activation Tuesday November 8 1800-0100

Hi Louis-

Just wanted to see if there is an election day camera salvo in the works that I should test out on Monday?

We just got the BPD computers back in house yesterday after reimaging and all is working well.

Mike

Subject: Re: MK:EOC Activation Tuesday November 8 1800-0100

Hi Mike,

There will not be a salvo as there are multiple voting locations throughout the city. Unless you have any intelligence that would provide a known route for potential protestors, it would be easier for you to open and view a desired camera should the need arise.

Subject: Re: Security Camera Strategy Meeting Status Report - 10/26/16

We got the PC!!

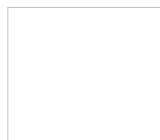

Just waiting on the Monitors.

Lou, Whenever you have time we can set it up - I know you are out of the office or going we can do it after.

I will use the monitors I have for now.

I assume we will still plan to use Bonet, Brett is there anything you need me to do before hand ?

Thanks everyone for your help, Mike Kane especially for staying on top of this and getting it done. Much appreciated

Subject: BriefCam Demonstration

Hello CIMS Working Group,

I apologize for the last minute nature of this message, but we have finally worked through some scheduling issues and have been able to arrange for a BriefCam demonstration at Lan-tel in Norwood on **Friday at 10am**. If you, or a representative from your organization, is available to join us please let us know. I will create a calendar invite with details. If you aren't able to join us at this time I am sure we can arrange for an additional demonstration in the future.

Best,

Subject: DVtel Basic Operator Training

Hi Eric,

I was talking with Rene today about the possibility of getting additional OEM staff familiarized with operating the DVtel system. We have a number of special events on the calendar this year it we think it may be best to deepen our bench in terms of individuals capable of fully utilizing the system. Would it be possible to have a few OEM staff members trained as basic operators, and how long would you suggest a training like that last? Feel free to give me a call if you have questions or need more details.

Thank you,

Deirdre

This is great timing .

We are gong to implement training 4 times a year in the Norwood training facility .

The first one will be on Feb 28 .

Notices are gong out Monday . However since you have a great facility as well we can do it in house as well as an added feature for OEM . 'Please give me a date that works for you and I will accommodate for inhouse

Awesome. I will let Rene know and get back to you. I know this is super last minute, but if she wants to get a few trained before the Super Bowl would it be feasible to fit an hour in at the EOC next week? I don't know for certain that she would ask that, but she might.

On another note and with more events coming up . Could I know in advance when Bragdon St is being stood up ? (planned or unplanned) Much like we do with BPD LECC. It would help me since I can dedicate resources for prechecks etc. or have on radar when in operation .

I think it would help all around instead of rushing to answer questions on the day of an event . I do not have any control of last mile on connectivity to Bragdon St like I do at other dispatch centers / Schroeder Plaza .Just a thought in case something was changed upstream .

Hi Eric,

I was talking with Rene today about the possibility of getting additional OEM staff familiarized with operating the DVtel system. We have a number of special events on the calendar this year it we think it may be best to deepen our bench in terms of individuals capable of fully utilizing the system. Would it be possible to have a few OEM staff members trained as basic operators, and how long would you suggest a training like that last? Feel free to give me a call if you have questions or need more details.

Thank you,

Deirdre

On another note and with more events coming up . Could I know in advance when Bragdon St is being stood up ? (planned or unplanned) Much like we do with BPD LECC. It would help me since I can dedicate resources for prechecks etc. or have on radar when in operation .

I think it would help all around instead of rushing to answer questions on the day of an event . I do not have any control of last mile on connectivity to Bragdon St like I do at other dispatch centers / Schroeder Plaza .Just a thought in case something was changed upstream .

This is great timing .

We are going to implement training 4 times a year in the Norwood training facility .

The first one will be on Feb 28 .

Notices are going out Monday . However since you have a great facility as well we can do it in house as well as an added feature for OEM . Please give me a date that works for you and I will accommodate for inhouse

Good Afternoon Kate and Eric,

I hope this email finds you well! Apologies for the late afternoon email, but I wanted to get this out to you.

As you know, the end date of the current CIMS contract#40555 is set to end July 31, 2017. The subcommittee, Deirdre and myself want to get ahead of the curve and extend the contract for time. We are proposing to extend the contract to align with the FAC64 state contract deadline of May 31, 2018. I've attached two documents for you to review and, if you approve, to sign:

- City of Boston Standard Contract Amendment (CM12)
- Certificate of Authority (CM-06)
- OEM Non Disclosure Form

Please let me know if you have any questions. If not, please sign in blue ink and mail them back to me at:

Subject: Reschedule: PSnet Meeting to Feb 14 afternoon, 2-4pm

Hello PSnet Executive Committee members, vendors ~

Due to scheduling conflicts with the morning of February 14, *the PSnet meeting needs to be rescheduled*. But we still want to celebrate Valentine's Day with you all, :) , so if possible my suggestion would be to push the meeting to the afternoon.

New proposed meeting time: 2pm (PSnet Exec, with vendors arriving 2:30) - 4pm, still on Tuesday February 14.

First question: Scott, can the Brookline Town Hall room reservation be shifted to 2pm?

Second question: All, please email me as soon as possible if you have conflicts with the new time so that we can assess and come up with Plan C if necessary.

Thank you!

Sarah

Subject: Re: Reschedule: PSnet Meeting to Feb 14 afternoon, 2-4pm

Hi Sarah,

The meeting rooms at Town Hall will not be available at that time.

Also, the Community Room at the station is booked all day for a command staff meeting.

So we will need a new location with this change

Subject: CIMS Contract Extension Documents

Good Afternoon Kate and Eric,

I hope this email finds you well! Apologies for the late afternoon email, but I wanted to get this out to you.

As you know, the end date of the current CIMS contract#40555 is set to end July 31, 2017. The subcommittee, Deirdre and myself want to get ahead of the curve and extend the contract for time. We are proposing to extend the contract to align with the FAC64 state contract deadline of May 31, 2018. I've attached two documents for you to review and, if you approve, to sign:

- City of Boston Standard Contract Amendment (CM12)
- Certificate of Authority (CM-06)
- OEM Non Disclosure Form

Please let me know if you have any questions. If not, please sign in blue ink and mail them back to me at:

Mayor's Office of Emergency Management (OEM)
Boston City Hall, Room 204
Attn: Eamon Miller
One City Hall Square
Boston, MA 02201

As always, thank you for all you do!

Eamon

Subject: Reschedule: PSnet Meeting to Feb 14 afternoon, 2-4pm

Hello PSnet Executive Committee members, vendors ~

Due to scheduling conflicts with the morning of February 14, *the PSnet meeting needs to be rescheduled*. But we still want to celebrate Valentine's Day with you all, :) , so if possible my suggestion would be to push the meeting to the afternoon.

New proposed meeting time: 2pm (PSnet Exec, with vendors arriving 2:30) - 4pm, still on Tuesday February 14.

First question: Scott, can the Brookline Town Hall room reservation be shifted to 2pm?

Second question: All, please email me as soon as possible if you have conflicts with the new time so that we can assess and come up with Plan C if necessary.

Thank you!

Sarah

Subject: Re: Reschedule: PSnet Meeting to Feb 14 afternoon, 2-4pm

Hi Sarah,

The meeting rooms at Town Hall will not be available at that time.

Also, the Community Room at the station is booked all day for a command staff meeting.

So we will need a new location with this change

No camera. And yes correct we will have our own laptop. I was looking at a pelican and gator cases with built in stands to make this a mobile solution.

Subject: Mike Kane : Vizio 70" flatscreen and stand quote request 15 sets and set up

Eric-

Can I get a quote for 15 units with set up.

Thanks my man,

Mike

Attachment(s): "OEM Vizio 70 Inch quote.pdf", "OEM LG 4k 70 Inch quote.pdf"

Mike
Here are the quotes for the monitors. I gave you an extra quote for LG 4K monitor since the Vizios are only 1080P. This is just to compare if you wanted more quality. Just a thought.

Here is also a contact for cases they are local ? Worcester will build to spec. ask for Dan. Worked with him in past

Hello all,

Just wanted to remind you and confirm that despite our lovely winter weather, the PSnet meeting is in fact still on tomorrow! Also don't forget we've had a change of time and venue. **The meeting tomorrow, February 14, will begin at 2pm (vendors, please arrive at 2:30pm). It will be held at the Somerville Police Department, at 220 Washington St, Somerville.**

Thanks, and see you tomorrow afternoon!

Shawn and Eric,

Can you send me an updated scope of work for the BPD HQ camera installation? I need to get it over to Lisa O'Brien and Jenny Prosser to start the contract process. The attached is the outdated one.

Thank you,
Eamon

Subject: 10 New Cameras

Hi,

Just checking what the procedure is for getting these 10 cameras installed? Is it as simple as letting Eric know that he can? Please let me know. This was part of our abstract and it was rolled into the CIMS project. Thanks/Pam

Re: Install 10 PTZs CIMS Network

Thank you for the opportunity to present LAN-TEL Communications, Inc.'s quote for the installation of the PTZ cameras. Our quote is based upon the information, the instructions, and requirements, reviewed. I am confident you will find our quote to be complete in terms of scope, compliant and consistent with State contract FAC64 along with information received. If you have any questions, please call me at (617) 413-2148, or simply e-mail me at ejohnson@lan-tel.com

I look forward to reviewing our proposal with you and thank you again for your continued consideration of LAN-TEL Communications, Inc.

Quote Summary:

LAN-TEL Communications, Inc.'s lump sum quotes to supply all labor, cable, coring, required equipment, project management, insurances and permits to successful complete the installation of the PTZ CCTV systems.

PTZ Camera Installation

1. Provide and install (10) DVTEL PTZ 30 X camera with required brackets and device licenses.
2. Provide and install (22) Ubiquiti antennas
3. Provide and install (10) NEMA enclosures.
4. Provide and install (10) photoelectric adapters
5. Provide and install (10) 5 port network switches
6. Provide and install (10) camera power supplies
7. Hardware, cable and bucket truck as needed.

Cost for equipment, hardware and labor will be:
\$55,186.00

Qualifications:

1. Normal working hours are between 7:00AM and 4:00PM Monday through Friday, excluding holidays, unless otherwise directed, with premium labor adjustments applied per approved change order protocol.
2. All security work is to be coordinated and completed by LAN-TEL.
3. We assume all conduits, coring, sleeves, workboxes, floor boxes, poke-thru with trim flanges, grounding backbone & bus bars, power, and rubbish removal from the central sweep point will be completed by LAN-TEL.
4. We shall fire-stop and seal only those sleeves, conduits, cores, utilized by LAN-TEL for the work specified.
5. We shall provide a one year product warranty under FAC64 against defects and on overall craftsmanship, starting from the date of substantial completion.
6. Warranty does not include any repairs of equipment damaged by vandalism, misuse, or "Acts of God".
7. Underground utilities are to be marked and located by the owner. LAN-TEL will not be responsible for any underground utilities improperly marked.
8. Job permits are included in the total proposal cost.
9. Full and uninterrupted access to all the work locations is required.
10. This proposal is in effect for 60 days unless otherwise extended by LAN-TEL.

Subject: Vendor representation at PSnet Meetings

Hello Chuck, Karen, and Eric,

I hope your Monday is wrapping up well! Just wanted to reach out briefly with an update concerning the upcoming PSnet meeting next week, and other future meetings as well. Per request from the PSnet Executive Committee, we're asking that Interisle, FTG, and LAN-TEL each send just one person as a representative to the PSnet meetings. This is an effort to strategically curb costs. If at times you would like to bring more than one representative, you are more than welcome to do so, but please only invoice for one.

Thanks very much,
Sarah

Attachment(s): "2.14.17 PSNEC minutes.pdf"

Hello PSnet Executive Committee & Vendors,

Attached please find the meeting minutes from our meeting a few weeks ago in February. Review at your own convenience. We'll leave a few minutes at the next meeting to comment on them and suggest any edits if they need to be made.

Also, by way of reminder, the next PSnet meeting is next week, Tuesday, March 14. Location will be Cambridge Water Department, first floor. (250 Fresh Pond Parkway, Cambridge). PSnet Exec members please arrive at 10am. Vendors please send your representative at 10:30.

Thanks very much!

Sarah

Hello Chuck, Karen, and Eric,

I hope your Monday is wrapping up well! Just wanted to reach out briefly with an update concerning the upcoming PSnet meeting next week, and other future meetings as well. Per request from the PSnet Executive Committee, we're asking that Interisle, FTG, and LAN-TEL each send just one person as a representative to the PSnet meetings. This is an effort to strategically curb costs. If at times you would like to bring more than one representative, you are more than welcome to do so, but please only invoice for one.

Thanks very much,
Sarah

Subject: [Update] POSPONED PSnet Meeting

Good Morning,

Per the Chair we are postponing the PSnet meeting originally scheduled for Tuesday morning. Due to the incoming weather we recognize that you may have other duties related to the storm which take priority over the meeting. We will be in touch soon with a rescheduled meeting date.

Take care,
Deirdre

PSnet Meeting

Hello all,

Thanks to David Mahoney for hosting our regular monthly meeting at the Cambridge Water Department. We'll be in the room on the first floor off to the right as you walk in.

A reminder, PSnet Exec Committee members (non-vendors) please arrive by 10am.

All vendors are not needed to arrive until 10:30am.

Thank you!
Sarah

Subject: PSnet Meeting Reschedule

Good Morning PSnet Executive Board Members and Vendors,

We are proposing that we reschedule the PSnet meeting originally planned for March 14th to March 28th at 10am. Please let me know by close of business today if that date and time poses major conflicts for you. Also, we would be looking for a location to host, so if you are able please let me know that as well.

Thank you,

Subject: Re: PSnet Meeting Reschedule

I'm good for the 28th

On Mon, Mar 20, 2017 at 10:00 AM, Deirdre Habershaw<deirdre.habershaw@boston.gov> wrote:

Good Morning PSnet Executive Board Members and Vendors,

We are proposing that we reschedule the PSnet meeting originally planned for March 14th to March 28th at 10am. Please let me know by close of business today if that date and time poses major conflicts for you. Also, we would be looking for a location to host, so if you are able please let me know that as well.

Thank you,

Attachment(s): "smime.p7s"

Linda,

I am working with Eric Nisbet at LAN-TEL (added to cc:list) to arrange testing of the new path into BoNet when the right users are available to confirm that everything continues to work as expected. When we have a timeslot scheduled, we will then perform the cutover, which requires LAN-TEL server config changes, and verify with the key users that there are no problems. Eric and I are also looking into whether we can perform a pre-test with one archiver.

We will provide updates as we move forward with these final steps...

Linda,

In case you haven't seen this already, I've forwarded the email thread involving myself, Jim, and Brett confirming that the BoNet connection into the CIMS 3850 switch at Schroeder Plaza is now up and ready for use.

I am now coordinating with the CIMS team to enable the CIMS servers to use this new connection. I am holding off advertising any CIMS routes into BoNet until I can work with the CIMS team to make sure that everything works as expected.

If you have any questions, let me know...

Since we have not enabled OSPF routing into PSnet from this switch, we're only seeing BoNet routes at this time.

I will update you when we've got the CIMS traffic flowing via this new connection.

Hi Chuck,

Including Brett as he is doing the BoNet config.

Jim

On Wed, Mar 15, 2017 at 1:38 PM, Chuck Wade <Chuck@interisle.net> wrote:

Jim,

I had assumed that the new BoNet connection for the CIMS servers on the 3850 would use OSPF routing as we do for the PSnet connections into BoNet. However, that appears to not be the case, as I am unable to establish OSPF peering.

In Brett's note, he mentions a static route to <[10.0.64.0/24](#)>, though the config listing he provided indicates that this is "not configured yet." If we're going to do this as static routes, then I need to know what routes I should point to the BoNet gateway address of <10.250.100.61>. BoNet should be able to add the static route to <[10.0.64.0/24](#)> via <10.250.100.62> at any time, since that is all configured. Note, it would also help to have a few known IP addresses within the BoNet video MPLS VPN that we can use for testing purposes.

I have copied below the relevant details for the OSPF routing that I set up, as well as the config info for the CIMS server configs on VLAN 64:

```

Security Camera Strategy Status Meeting – 3/29/17

Time: **Wednesday, 3/29/2017, 9:00AM – 10:00AM (Bi-weekly schedule. Next meeting = 4/12/2017)**
Location: Conference Room 115 / Dial In: 1-866-715-6967, Passcode: 4466461 (Host: 7860059)
Called by: Linda Calnan x2875

I. Agenda-Locations / Status Updates / Action Items

Locations: (Updates in bold:)

- **BHA – Working with Genetec and BHA on enhanced federation logistics.** BHA Genetec upgrade in progress. Expected completion = Friday – Mauori managing. Linda working with Genetec/Siemens on enhanced federation via City Hall core upgrade to 5.5 over next ~4 weeks. - (400+ cameras; BPD=view only access)
- **22 Dry Dock:**
 - **Sail Boston - Ready date = 6/1; events start 6/12:**
 - Rene hosting communications planning meeting for 3/27 to review and try to finalize plans
 - Linda working with Siemens on additional cameras and van for temp set up
 - Jascha and Rene have set guidelines on the following:
 - § Temporary event set up only – the office space has future use planned
 - § 1GB bandwidth only – no increase needed
 - § Video monitors to be in 3 rooms only – JOC/OPS, TOC, Intell
 - DoIT& BPDA to follow up with access to I&D Bldg outward facing cameras.
 - Security desk at 22 Dry Dock moving to 12 Channel – delayed per John O'Brien (waiting on new date). Linda working with BPDA and BPD get this moving again.
- **City Hall Core System & Municipal Security System:**
 - **BTD / City Hall Core: Genetec system upgrade to v5.5 & Vidsys system upgrade to v7.7.1** – Upgrade work resumed. Upgrade to be coordinated with BHA upgrade. VidSys upgrade requires workstation VidSys application updates to each workstation. Louie and Mike to handle updates.
- **BFD – Fire Alarm access to BPD Cameras – Lan-Tel and PSnet to make further configuration changes.** Chuck also needs to enable routing of the CIMS traffic. Linda has requested the timeline for this.
- **Strand Theater- Restarted project with Ellen McDonough. Unfortunately, her last day was 3/10. Looking for new contact to work with.**
- **Downtown Crossing – Same update/No movement** – BPD waiting on approval to proceed.

Security Camera Strategy

Status Meeting – 3/29/17

Shawn/Louie managing.

- **Chinatown – Same update – On Hold** due waiting on required documentation from BPD. Will resume in 1-2 weeks. 20 of 37 cameras complete – expected completion ~mid-April. BPD working with captain and local business to put cameras on roofs. Louie/Shawn managing.
- **BPD HQ – Equipment has been ordered.**
- **BPD & Coast Guard, Harbor Installation** - ~27 cameras to BPD DVTel system. Lan-Tel to install cameras. 2/13 BPD rec'd OK to Proceed. Shawn managing.
- **Cambridge St. Guard shack – On Hold** - due to contract negotiations. New cameras to be installed for add'l views of City Hall. Mike is managing.
- **Canterbury Street, Public Works (Comcast 100MG) (Warehouse for city lighting-theft & security issues) – On Hold** - Waiting on Public Works final approval of quote provided by Siemens for 16 cameras and local archiver.
- **Water & Sewer – HQ-Harrison Ave (78 cameras) & Alford St (37 cameras) – On Hold - due to budget issues.** Joe Crossen is managing.
- **BCYF – 112 Paris St. Fiber & Cameras – Same update: Construction scheduled to complete ~June 2017.** Plan to install pt-to-pt wireless connection for 15+ cameras. Network connectivity also required for ~45 workstations. No VoIP requirements initially. (Fiber connectivity to BoNet – is included in Mike Lynch dark fiber RFP.)
- **Fiber Maps – GIS map of Comcast fiber for COB - completed.** Linda working with Genetec on camera mapping.
- **Body Cams** – Pilot extended to June. Pilot began 9/12, successful thus far. Shawn/Louie managing next steps.
- **Training for Louie to be certified with VidSys and DVTel approved by Chief.** - VidSys training ~ 7/2017

Roadblocks / Critical issues:

- None.

Security Camera Strategy Status Meeting – 3/29/17

II. On regular bi-weekly schedule.

Subject: RE: PSnet - Ritz Mods for new Revere Hotel site

I copied Eric from Lantel on this question, if LanTel is working on this issue or a piece of this issue, we should wait until we understand from them,

what needs to be done, and in what order. I believe most of the equipment discussed is CIMs equipment, but I will turn to Lantel to confirm what is Cisms and what is Psnet.

So, if the equipment is Camera equipment, Lantel will handle, if part of the equipment is Psnet, the committee will address how to handle that, and what equipment would need to be replaced. But at this point, we have one vendor working on the problem, let them finish what they are responsible for, then we can evaluate what the next steps are.

My feeling is having 2 vendors dive into the same problem, the left hand does not know what the right hand is doing, that usually ends up bad.

Thanks,

Scott

Subject: PSnet - Ritz Mods for new Revere Hotel site

Importance: High

All,

Intermapper shows continuous alerts from the PSnet switch Ritz SwA. The nature of the alerts indicate "Transmit Discarded Packet" issues are occurring in significant bursts.

We asked Interisle for info on this condition and they advised as follows:

That problem started a week or so ago, and I've already suggested to the LAN-TEL folks that they take a look at the cabling from that interface to the radio when they're next on that site. We might disable the alerts for that interface, but this is one of the features that is a bit flaky with the recent versions of InterMapper (it's also a recently added feature). Note, this site is in a state of flux, as it is being upgraded and a new backbone link to the Revere Hotel is now online, and will soon be carrying traffic. In other words, this is an active work project driven by LAN-TEL with support from Interisle.

The LAN-TEL team handles configuration of these links that are really only for camera systems, and Fred helps out with tuning and overall frequency management. Fred and I deal with the network issues for these links.

We understand that Lan-Tel is performing work at the Revere Hotel under their CIMS contract, but we believe that the RitzSwA (HP) will need to be replaced with a switch capable of OSPF in order to add the traffic from the Revere Hotel and use the MIT Wireless Bridge as a backup. Currently the HP 2510 switch at the Ritz is not routing its own traffic and the switch at MIT is doing the routing. With both links installed at the Ritz, FTG would recommend that the routing happen locally at the Ritz for efficient failover between connections.

Please confirm that any re-design and/or switch replacement at the Ritz or MIT should be performed by FTG, unless there is a budgetary factor such that the Ritz switch replacement would be covered under the CIMs contract vs. PSnet, and therefore Lan-Tel will perform that work as Interisle states above.

Further, we believe that re-configs may be necessary for the MIT wireless bridge connection, which can be part of a further design conversation with Interisle.

From the Interisle note above, this work appears imminent. We'll complete an on-line incident report as well, which will rely on the detail above.

Please review and let me know if you have any questions or wish to discuss.

Regards,
Karen

Hello all, I've added Chuck to this. Now, it seems that all three vendors hopefully are all getting the messages/message! In reading what has been put out today, I have a few questions and it disturbs me deeply that we will have to pay for responses to this.

Are people staying in their lane? Is this Revere Hotel issue an emergency and is it PSNET related?

Lastly, and more important; why are the vendors sharing information and NOT including people that are mentioned and may be affected by these problems. I do not find this to be professional and frankly exactly what we are trying to avoid as we move forward.

I will continue to investigate this and discuss at our next meeting.

Sincerely,

Sgt. Michael Kiely

Subject: Re: PSnet - Ritz Mods for new Revere Hotel site

Good Evening :

A quick history lesson. In just the past year the DTX/ Chinatown cameras have gone from 10 cameras to 60 and this is projected to double. The legacy BPD- CIMS antenna hubs at the Ritz and Revere have always been BPD camera sites and they do not share any backhaul antennas to other UASI partners. The new camera work necessitates the upgrade of these sites to accept this new camera traffic. Because of minimal budget and not to impact CIMS funding, we have been performing this work sporadically by utilizing hours from associated camera projects that must connect to these same antenna hubs. In doing this work we have used spare equipment. The switch mentioned in the prior email is a spare. This is indeed a work in progress, and I would simply recommend that the monitoring be disabled that is specific to the TDP errors received. I believe we have this under control and we will update when this work has been completed.

I would like to add that this is certainly not an emergency, all cameras and equipment for BPD Area A are on line and functioning and we have not seen any failures or disruption of service from this site when we look at direct GUIs of associated equipment when worked on. I am also confident that the OSPF question raised will be rectified upon completion of this work performed on this BPD - CIMS equipment. If this work is impacting any service upstream on PSNET equipment other than then the TDP messages, we will work with Interisle or FTG to correct this immediately.

Also, to further resolve this issue quickly, we will be on site tomorrow at Ritz hub to change ports on the spare switch and hopefully this could clear up the TDP messages as well. We will notify everyone on this progress when completed.

Please know that I am available direct anytime for any issues or camera questions 24/7 for all involved within this network.

Thanks !

Eric Johnson

Subject: System Shutdown

On Monday there is going to be a electrician at the RPD to redo some of the electrical in room 111 off of dispatch. One of the issues will be the plug that your servers and equipment is plugged into.

I don't know if that stuff is plugged into battery backup, so if not there will be some down time.

If there is something that needs to be done before hand please let me know.

Subject: Re: System Shutdown

Attachment(s): "smime.p7s"

Steven,

The PSnet switches and BridgeWave microwave radio are plugged into a Tripp Lite PDU with an Automatic Transfer Switch (ATS). This PDU has a primary and secondary source for AC power, which means two separate cords. The last time I checked, one of the AC sources (primary) is plugged into the APC SmartUPS-3000 in the bottom of that rack, while the secondary connects into the outlet that your electrician provided above the rack. As long as one of these two power cords remains connected to a live AC source, then we should not see any power outage for the switches and microwave link.

However, the CIMS video server(s) are not currently plugged into this PDU, though these servers do have separate power feeds. I believe that one or both of the server power feeds are plugged into the APC UPS in that rack.

Since FTG recently replaced the battery in the APC UPS, it should maintain power through a brief outage.

Note that the intent is to eliminate the APC SmartUPS-3000 in that rack, and have everything operating off of your system UPS for the RECC. Perhaps Monday would be a good time to get everything off the APC UPS. Any critical equipment that has only a single power cord can be plugged into the PSnet Tripp Lite PDU. I only ask that you let me know what is plugged into each outlet so that we can keep track of outlet assignments. Your SG300 switch would be a good candidate for the PDU, since I don't believe it has dual power supplies and feeds, but is certainly critical to your RECC services, including your telephone services.

I can be available Monday to assist with any issues or questions that crop up.

Subject: Re: PSnet - Ritz Mods for new Revere Hotel site

Good morning All,

After looking through the notes from the PSnet EC meeting the committee made it very clear to FTG that we wanted them to step up and become more involved in the day to day resolution of issues. That was one of the reasons that we added them to the intermapper alert emails in the first place. We encouraged them to speak up when they recognized an issue where they felt they may be able to provide assistance. We also noted that there would be some growing pains as we rolled this out and FTG became more familiar with the frequency and severity of alerts. It seems to me this is a perfect example of exactly what we anticipated may play out and I am confident we will be able to get to a place where these hiccups can be avoided.

However, I would ask that all vendors include the two other vendors on correspondence regarding the network. Especially if that correspondence includes reference to the third vendor. In this instance, when FTG inquired with Interisle regarding this site and it was communicated that Lan-tel was performing work at the site, Lan-tel should have then been engaged before reaching out to the committee.

We would ask that going forward that the three vendors consult with each other before seeking intervention from the committee.

If you have any questions or concerns please do not hesitate to reach out to myself or Sarah.

On Tue, Apr 4, 2017 at 5:39 PM, Michael Kiely<mkiely@police.somerville.ma.us> wrote:

Hello all, I've added Chuck to this. Now, it seems that all three vendors hopefully are all getting the messages/message! In reading what has been put out today, I have a few questions and it disturbs me deeply that we will have to pay for responses to this.

Are people staying in their lane? Is this Revere Hotel issue an emergency and is it PSNET related?

Lastly, and more important; why are the vendors sharing information and NOT including people that are mentioned and may be affected by these problems. I do not find this to be professional and frankly exactly what we are trying to avoid as we move forward.

I will continue to investigate this and discuss at our next meeting.

Sincerely,

Sgt. Michael Kiely
Homeland Security &
Emergency Management

On Apr 4, 2017, at 4:32 PM, Scott Wilder <swilder@brooklinema.gov> wrote:

I copied Eric from Lantel on this question, if LanTel is working on this issue or a piece of this issue, we should wait until we understand from them,

what needs to be done, and in what order. I believe most of the equipment discussed is CIMs equipment, but I will turn to Lantel to confirm what is Cisms and what is Psnet.

So, if the equipment is Camera equipment, Lantel will handle, if part of the equipment is Psnet, the committee will address how to handle that, and what equipment would need to be replaced. But at this point, we have one vendor working on the problem, let them finish what they are responsible for, then we can evaluate what the next steps are.

My feeling is having 2 vendors dive into the same problem, the left hand does not know what the right hand is doing, that usually ends up bad.

Thanks,

Scott

Subject: PSnet - Ritz Mods for new Revere Hotel site
Importance: High

All,

Intermapper shows continuous alerts from the PSnet switch Ritz SwA. The nature of the alerts indicate "Transmit Discarded Packet" issues are occurring in significant bursts.

We asked Interisle for info on this condition and they advised as follows:

That problem started a week or so ago, and I've already suggested to the LAN-TEL folks that they take a look at the cabling from that interface to the radio when they're next on that site. We might disable the alerts for that interface, but this is one of the features that is a bit flaky with the recent versions of InterMapper (it's also a recently added feature). Note, this site is in a state of flux, as it is being upgraded and a new backbone link to the Revere Hotel is now online, and will soon be carrying traffic. In other words, this is an active work project driven by LAN-TEL with support from Interisle.

The LAN-TEL team handles configuration of these links that are really only for camera systems, and Fred helps out with tuning and overall frequency management. Fred and I deal with the network issues for these links.

We understand that Lan-Tel is performing work at the Revere Hotel under their CIMS contract, but we believe that the RitzSwA (HP) will need to be replaced with a switch capable of OSPF in order to add the traffic from the Revere Hotel and use the MIT Wireless Bridge as a backup. Currently the HP 2510 switch at the Ritz is not routing its own traffic and the switch at MIT is doing the routing. With both links installed at the Ritz, FTG would recommend that the routing happen locally at the Ritz for efficient failover between connections.

Please confirm that any re-design and/or switch replacement at the Ritz or MIT should be performed by FTG, unless there is a budgetary factor such that the Ritz switch replacement would be covered under the CIMS contract vs. PSnet, and therefore Lan-Tel will perform that work as Interisle states above.

Further, we believe that re-configs may be necessary for the MIT wireless bridge connection, which can be part of a further design conversation with Interisle.

From the Interisle note above, this work appears imminent. We'll complete an on-line incident report as well, which will rely on the detail above.

Please review and let me know if you have any questions or wish to discuss.

Regards,

Karen
