

VidSys provides a transformational Physical Security Information Management (PSIM) software platform used to run operations centers for public sector agencies and leading enterprise organizations. The platform continuously fuses and instantly correlates vast amounts of data gathered from any number or virtually any type, brand or generation of physical security system or sensor, as well as from networked management applications.

In the case of the Dvtel, Avigilon, Genetch and legacy CCTV systems which are all currently deployed on the City of Boston. The software development kit (SDK) of each respected software is given to VidSys engineers and a “connector” is written for each respected software. This integrates all cameras through the connector from the disparaged systems and is a true genesis of uniting all cameras into a single platform or dashboard for the end user to display and control. There can be several end users on the system at the same time for real time situational awareness.

Because all systems have access to each others network via BONET it makes for an easier connection for network connectivity and bandwidth considerations
